

Given the system

$$dx/dt = Ax, \quad (2)$$

where  $A$  is a  $2 \times 2$  matrix and  $x$  is  $2 \times 1$  vector, an **equilibrium solution** (or **critical point**) for the system (2) is a point where

$$Ax = 0$$

If  $A$  is nonsingular (it has an inverse), then the only critical point for system (2) is

$$x = 0$$

## Chapter 9 Nonlinear Differential Equations And Stability:

*Elementary Differential Equations and Boundary Value Problems, International Adaptation* William E. Boyce, Richard C. DiPrima, Douglas B. Meade, 2022-08-23 Boyce's *Elementary Differential Equations and Boundary Value Problems* is written from the viewpoint of the applied mathematician with diverse interest in differential equations ranging from quite theoretical to intensely practical and usually a combination of both. The intended audience for the text is undergraduate STEM students taking an introductory course in differential equations. The main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent while a basic familiarity with matrices is helpful. This new edition of the book aims to preserve and to enhance the qualities that have made previous editions so successful. It offers a sound and accurate exposition of the elementary theory of differential equations with considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications.

*Boyce's Elementary Differential Equations and Boundary Value Problems, Global Edition* William E. Boyce, Richard C. DiPrima, Douglas B. Meade, 2017-04-17 Boyce's *Elementary Differential Equations and Boundary Value Problems* like its predecessors is written from the viewpoint of the applied mathematician whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate but not abstract exposition of the elementary theory of differential equations with considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications. While the general structure of the book remains unchanged, some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications. In addition to expanded explanations, this edition includes new problems, updated figures, and examples to help motivate students. The program is primarily intended for undergraduate students of mathematics, science, or engineering who typically take a course on differential equations during their first or second year of study. The main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent. Some familiarity with matrices will also be helpful in the chapters on systems of differential equations.

**Mathematical Models in the Biosciences I** Michael Frame, 2021-06-22 An award-winning professor's introduction to essential concepts of calculus and mathematical modeling for students in the biosciences. This is the first of a two-part series exploring essential concepts of calculus in the context of biological systems. Michael Frame covers essential ideas and theories of basic calculus and probability while providing examples of how they apply to subjects like chemotherapy and tumor growth, chemical diffusion, allometric scaling, predator-prey relations, and nerve impulses. Based on the author's calculus class at Yale University, the book makes concepts of calculus more relatable for science majors and premedical students.
