NET Core** Akhil Mittal,2019-03-22 A handbook to get familiar with the Microservices concept and developing microservices using ASP NET Core This is a small book to cover the topic of microservices using a practical approach Section 1 The Concept makes you familiar with the concept of the Microservices This section explains what are microservices the architecture of microservices the difference between monolithic and microservices This section builds a deep understanding

of microservices concept and architecture which is very important before you start development on microservices Section 2 Docker section three of the book demonstrates the development of microservices and running microservices in separate instances at the same time One of the instances would be running in a docker container This section demonstrates the pre requisites of having the microservice running in Docker and Docker installation Section 3 Microservice using ASP NET Core this section will train you on how to create a microservice using ASP NET Core This section is a step by step guide to create a microservice using ASP Net Core and Entity Framework Core and deploy and run the microservice   NET Core Microservices Piotr Gankiewicz,2017 Microservices are an architectural style that promotes the development of complex applications as a suite of small services based on business capabilities This course will help you identify the appropriate service boundaries within the business We ll start by looking at what microservices are and their main characteristics We will develop a basic distributed system using the microservice architecture and tools such as RabbitMQ service bus to send messages across the separated services or MongoDB which is a NoSQL database Within the course we will focus on creating the HTTP API to act as a gateway to the whole system and so called Activities Service responsible for handling the incoming messages or actually the commands that will be distributed through the services bus We ll also implement the Identity Service which will serve JSON Web Tokens JWT to authenticate requests incoming to the API Our application will let the user store information about the activities performed at a given date for a selected category for example work tasks sport and so on Once the request to save the activity is published within the system the Activities Service will handle the business logic and decide whether the activity is valid which will eventually result in publishing the event about processing the successful or rejected activity In the course you will also learn about commands and events as well as handlers which is one of the most popular design patterns when it comes to creating distributed systems By the end of the course your services will be built using ASP NET Core framework and later on you will use tools such as Docker and Docker Compose to pack your application into the container and deploy it to the virtual machine running in the cloud Resource description page
