**Microwave Non-Destructive Testing and Evaluation Principles** R. Zoughi, 2014-01-15 **Microwave Non-Destructive Testing and Evaluation Principles** R. Zoughi, 2012-12-06 Microwave and millimeter wave non destructive testing and evaluation NDT E is generally understood to mean using high frequency electromagnetic energy to inspect and characterize materials and structures In spite of possessing some distinct advantages in certain applications to other NDT E techniques microwave NDT E has only found compared limited practical application during the past 45 years These advantages include lack of a need for contact between the sensor and the object being inspected the ability to penetrate dielectric materials and superior sensitivity to certain material constituents and flaws One factor contributing to this minimal acceptance by the NDT E community has been a generally poor understanding in this community of the theory and practice that underlie the technology This situation exists partly because of a paucity of microwave NDT E textbook and reference material Some chapters reviews and books aimed at filling this need have been published in the past but for the most part this material is based on the use of older microwave technology However during the past ten years great strides have been made in terms of the cost size and ease of use of microwave components In addition recent advances in modeling and measurement techniques have expanded the range of applications for microwave NDT E Such applications include inspecting modern materials such as composites detecting and characterizing surface flaws and evaluating the compressive strength of cement structures These advances have created an urgent need for up to date textbook material on this subject

**Polymers and Electromagnetic Radiation** Wolfram Schnabel, 2014-01-10 This first book to cover the interaction of polymers with radiation from the entire electromagnetic spectrum adopts a multidisciplinary approach to bridge polymer chemistry and physics photochemistry photophysics and materials science The text is equally unique in its scope devoting equal amounts of attention to the three aspects of synthesis characterization and applications The first part deals with the interaction of polymers with non ionizing radiation in the frequency range from sub terahertz via infrared radiation to visible and ultraviolet light while the second covers interaction with ionizing radiation from the extreme ultraviolet to ray photons The result is a systematic overview of how both types of radiation can be used for different polymerization approaches
