

## Study guide:

- General:
  - To do:
    - Repeat the problem out loud, slowly but confidently.
    - Ask questions, check assumptions, know what the constraints are.
    - Talk out the problem!
    - Work out examples on the whiteboard, devising some kind of brute force algorithm along the way.  
*Don't stay silent here.*
    - Start with **naive** simplest brute force solution.
    - Check edge cases and do null checks.
    - Work out examples using the code/algorithm; keep track of state by hand.
    - When debugging, *don't rush*. Don't guess and check—make sure I know exactly what went wrong and how to fix it. Preventatively: don't try to be too clever.
    - Know time/space complexity: <http://bigocheatsheet.com/>
  - Heuristics and guidelines:
    - Always consider hash tables (dictionaries) with their  $O(1)$ -ness.
      - "Tip: using a dictionary is the most common way to get from a brute force approach to something more clever. It should always be your first thought."
      - Sets are also extremely useful if all I care about is unique elements and membership testing.
      - Don't be afraid of using one even for graph traversals. Worry about optimizing space later.
    - If at all array-related, try sorting first.
    - If search-related, consider binary search.
      - "Binary search teaches us that when a list is sorted or mostly sorted:
      - The value at a given index tells us a lot about what's to the left and what's to the right.
      - We don't have to look at every item in the list. By inspecting the middle item, we can "rule out" half of the list.
      - We can use this approach over and over, cutting the problem in half until we have the answer. This is sometimes called "divide and conquer."
      - For binary search, consider floor and ceiling as exclusive walls.
    - Start with a brute force solution, look for repeat work in that solution, and modify it to only do that work once.
