

# Origin of the Earth

The Earth probably formed from material in the solar nebula—the cloud of gas and dust that led to the formation of the Sun. This material gradually grew into a larger and larger body that became a red-hot ball of rock and metal. Later the rocky crust formed, its surface cooling enough to allow the continents to appear. Even later the oceans arrived, as well as the tiny organisms that released oxygen into the atmosphere. Although much of this gas was initially consumed in chemical reactions, over time, it allowed the development of multicellular organisms and an explosion of life that took place at the start of the Paleozoic Era, 542 million years ago.

## Continental Drift

Over time the continents, which are part of tectonic plates that drift across the Earth's surface at the rate of a fingernail's growth, 1/32 inch per year, have shifted, broken up, and reformed over part of the planet's history. When tectonic plates are pushed together, they can push together and create mountains, or when the plates separate, a rift forms. The plates move together and pull apart through the forces of heat that originates from the different tectonic plates. When plates collide, a mountain range can form. When plates pull apart, a rift valley can form. The plates are constantly moving, changing the face of the planet.

**1 450 MILLION YEARS AGO**  
The supercontinent Gondwana formed as tectonic plates pushed together.

**2 350 MILLION YEARS AGO**  
The Tethyan Sea forms with Europe, creating two continents, leading to forests and flowers.

**3 250 MILLION YEARS AGO**  
Continents split, forming Africa and North America as the southern continent drifts into oceans.

## Origin of the Earth

The Earth was formed 4.5 billion years ago from a cloud of dust and gas. In the beginning, it was a molten, scorching sphere made of iron, nickel, and other heavy metals, and the atmosphere was made of hydrogen and helium.

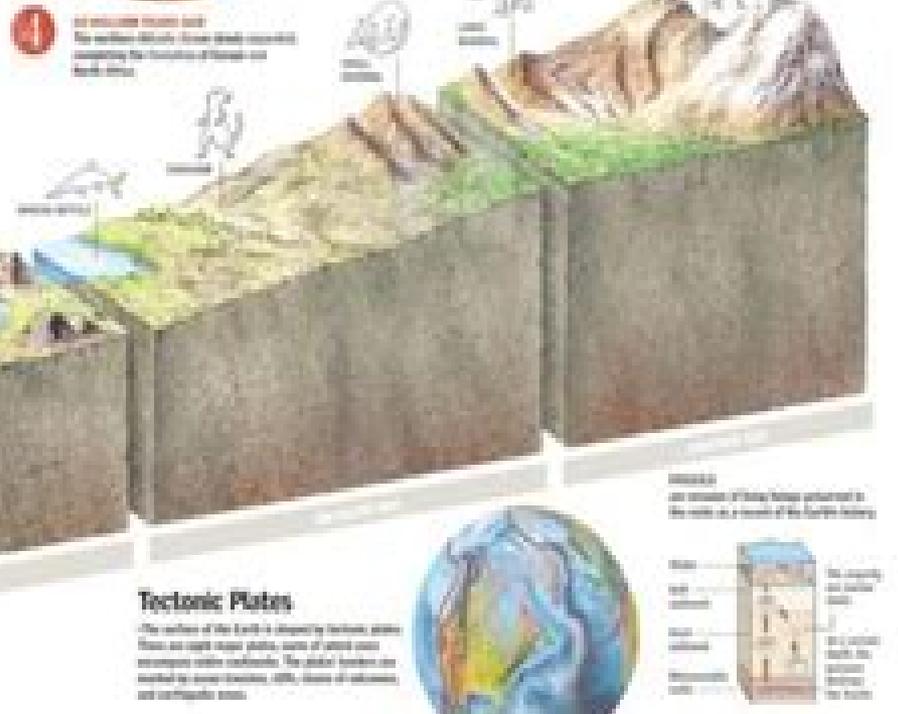

- 1** The Earth was formed from a cloud of dust and gas.
- 2** The molten sphere of iron and nickel cooled and solidified.
- 3** The oceans formed on the Earth's surface.
- 4** The continents formed on the Earth's surface.

## Chronology

Chronology is the study of time in the Earth's past. It includes the study of fossils and other evidence to determine the age of rocks and the sequence of events in the Earth's history.

Through the study of fossils, evidence of ancient life in the Earth's past is uncovered. Fossils are the remains of plants and animals that lived in the past.

**1** The earliest fossils are found in the Cambrian period, including the trilobites and other marine life.

**2** The dinosaurs lived on land during the Mesozoic era, including the T-Rex and other large reptiles.

**3** The first plants and animals appeared on land during the Paleozoic era, including the first trees and insects.

**4** The first mammals appeared during the Mesozoic era, including the first primates and other small mammals.

**5** The first birds appeared during the Mesozoic era, including the first dinosaurs and other large reptiles.

**6** The first modern humans appeared during the Pleistocene era, including the first hominids and other early humans.

**7** The first modern humans appeared during the Pleistocene era, including the first hominids and other early humans.

**8** The first modern humans appeared during the Pleistocene era, including the first hominids and other early humans.

## Tectonic Plates

The surface of the Earth is composed of tectonic plates. These are rigid upper plates, some of which are composed of both crust and upper mantle. The plates' boundaries are marked by major features, such as ridges, trenches, and transform faults.

This volume is the fifth in the definitive series *The History of the Study of Landforms or the Development of Geomorphology*. Volume 1 (1964) dealt with contributions to the field up to 1890. Volume 2 (1973) with the concepts and contributions of William Morris Davis. Volume 3 (1991) covered historical and regional themes during the classic period of geomorphology (1890-1950). Volume 4 (2008) concentrated on studies of geomorphological processes and Quaternary geomorphology between 1890 and 1965. By the end of this period, process-based studies had become dominant. Volume 5 builds on this platform, covering in detail the revolutionary changes in approach that characterized the study of geomorphology in the second half of the twentieth century. It is divided into three sections: the first deals with changes in approach and method; the second with changes in ideas and the broader scientific context within which geomorphology is studied; and the final section details advances in research on processes and landforms. The volume's objective is to describe and analyze many of the developments that provide a foundation for the rich and varied subject matter of the twenty-first century.
