Simulation-based Search for Hybrid System Control and Analysis Todd William Neller,2000 Abstract This dissertation explores new algorithmic approaches to simulation based optimization game tree search and tree search for the control and analysis of hybrid systems Hybrid systems are systems that evolve with both discrete and continuous behaviors Examples of hybrid systems include diverse mode switching systems such as those we have used as focus problems stepper motors magnetic levitation units and submarine detection avoidance scenarios For hybrid systems with complex dynamics the designer may have little other than simulation as a tool to detect design flaws or inform offline or real time control In approaching control and analysis of such systems we thus limit ourselves to a black box simulation of the system Among our algorithmic contributions are the first multi dimensional information based optimization approach a generalization of previous multi level optimization methods information based alpha beta game tree search syntheses of cell mapping and game tree search techniques iterative refinement approaches for dynamic action timing discretization a best first search variant with dynamic time step refinement iterative refinement with an epsilon variant of recursive best first search and a dispersion technique for dynamic action parameter discretization We also formally define several hybrid system game tree and tree search problems
