ABSTRACT: Increasing popularity of feature selection in bioinformatics has led to the development of novel algorithms using neural networks. The objectives of the adaptation of neural networks architectures are proposed on efficient and optimal model for feature classification and selection. A competitive and unique approach in feature selection is adopted here using a convolutional neural network (CNN). Deep learning approach on feature selection is the novel idea which can contribute to the evolution of identification process, diagnostic methods etc. The experimental work has given good result of ranking the attributes by building a CNN model. The traditional concept of CNN for classification has transformed to a modern approach for feature selection. Handling millions of data with multiple class identities can only be classified with a multi layers network. The CNN models are trained in completely supervised way with a batch gradient back propagation. The parameters are tuned and optimized to get better build type.

1. INTRODUCTION

Big data analysis is a primary area in data mining with large prospects in data intelligence, cyber security, marketing and medical informatics. Research works are been carried out in medical sector in many diagnostic experiment for extracting disease patterns and features. The role of deep learning algorithms persists in such studies for analysing high dimensional data which perform distributed computing. Models have to be build and scaled for data sampling to final results. It needs a lot of activities like semantic indexing, semi supervised learning and active learning.

The bridging of symbolic aspect of biometric data to a feature model is the core challenge in data mining. Pattern mining is a classical solution that generated better result in previous studies. Some other techniques used with frequent pattern mining is sub tree mining, perception collector, semantic feedback, Twig join etc. The frequent patterns item sets, sub sequence, sub structures that has a common characteristic in its frequency. A multilevel rule mining with apriority and tree based approach using a sequential pattern were the initial tools. The challenge in the form of memory efficiency was still pursuing all the present methods. It is observed that modelling different algorithms to work collectively is not been implemented so far. This work focuses the frequent pattern based classification intended for deep understanding and interpretation of patterns. The research issue related with deep insight in data can be resolved with deep learning algorithms.

2. RELATED WORKS

The researchers in data mining started with associated rule mining. Associates rules are usually required to satisfy a user specified support and confidence level. Some usual association rule mining algorithm like Apriority, Eclat and FP growth. The Apriority algorithm designers to operate on a given item set by finding the subsets. Output of Apriority is also a set of rules [1], there are improvement added to apriority for reducing query frequencies and stage resources. One such algorithm that doesn't need candidate generation is given [2].
