

# PRESTRESSED CONCRETE BRIDGES

## 14.1 SCOPE

Bridges are structures that perform at least one single but major function: that of providing a simple means to cross or reach between two points separated by a deep valley, a river, a highway, or the like. Bridges offer structural engineers the opportunity to express simultaneously functionality and beauty while being unique; they have generated a continuous fascination in people, regardless of place and time. This is so much so that, symbolically the term "bridge" is used to describe connectivity between nations, races, religions, communities, etc. and implies reaching out to the other as a sign of friendship and peace.

Bridges must be carefully planned and engineered before they can be constructed. Their final design must satisfy not only technical constraints related to strength, safety and provisions for future expansion, but also environmental, aesthetic, financial, and political constraints. A bridge is a key element in a transportation system for three reasons [Ref. 14.8]:

- It controls the capacity of the system
- It is the highest cost per mile of the system
- If it fails, the system fails.

Moreover the bridge controls both the volume and the weight of the traffic carried by the transportation system, in the present and the foreseeable future.

There are many advantages in using prestressed concrete for bridges. Among them are minimum maintenance, increased durability, good aesthetics, and, when factory precast elements are used, assured plant quality, fast and easy construction, and low initial cost.
