

Systems of Equations – Mixture Problems

Objective: Solve mixture problems by setting up a system of equations.

One application of systems of equations are mixture problems. Mixture problems are ones where two different substances are mixed together resulting in a new third substance. We will use the following table to help us solve mixture problems.

	Amount	Pure	Total
Substance 1			
Substance 2			
Total			

The first column is the total amount of each item we have. The second column is labeled "pure". If we take percentages we will get the pure amounts as a decimal in this column. If we add them we will get values in this column. There are two ways to do this. We can multiply the amount for the pure by itself the total. There are two ways to do this. We can multiply the amount and we total amounts that will help us solve the problem and answer the question.

These problems can have either one or two variables. We will start with one variable problems.

Example 1.

A chemist has 10 mL of a 30% methanol solution. How much of a 60% solution must she add to the first solution to 60% methanol?

	Amount	Pure	Total
Substance 1	10	3%	
Substance 2	x	60%	
Total			

Now apply the mixture table. We start with 10 mL and don't know how much we will add, that is x. Then we will get percentages. 3% for pure, 60% for pure, 60% for pure.
