Munson, 2003 We introduce a lazy XSLT interpreter that provides random access to the transformation result This allows efficient pipelining of transformation sequences Nodes of the result tree are computed only upon initial access As these computations have limited fan in sparse output coverage propagates backwards through the pipeline In comparative measurements with traditional eager implementations our approach is on par for complete coverage and excels as coverage becomes sparser In contrast to eager evaluation lazy evaluation also admits infinite intermediate results thus extending the design space for transformation sequences To demonstrate that lazy

evaluation preserves the semantics of XSLT we reduce XSLT to the lambda calculus via a functional language While this is possible for all languages most imperative languages cannot profit from the confluence of lambda as only one reduction applies at a time *Merchant Vessels of the United States (including Yachts and Government)* United States.
