Proceedings of Transpac '84, 1985 *Aeronautical Engineering*, 1991 **Computational Intelligence in Expensive Optimization Problems** Yoel Tenne, Chi-Keong Goh, 2010-03-10 In modern science and engineering laboratory experiments are replaced by high fidelity and computationally expensive simulations Using such simulations reduces costs and shortens development times but introduces new challenges to design optimization process Examples of such challenges include limited computational resource for simulation runs complicated response surface of the simulation inputs outputs and etc Under such difficulties classical optimization and analysis methods may perform poorly This motivates the application of computational intelligence methods such as evolutionary algorithms neural networks and fuzzy logic which often perform well in such settings This is the first book to introduce the emerging field of computational intelligence in expensive optimization problems Topics covered include dedicated implementations of evolutionary algorithms neural networks and fuzzy logic reduction of expensive evaluations modelling variable fidelity fitness inheritance frameworks for optimization model management complexity control model selection parallelization of algorithms implementation issues on clusters grids parallel machines incorporation of expert systems and human system interface single and multiobjective algorithms data mining and statistical analysis analysis of real world cases such as multidisciplinary design optimization The edited book provides both theoretical treatments and real world insights gained by experience all contributed by leading researchers in the respective fields As such it is a comprehensive reference for researchers practitioners and advanced level students interested in both the theory and practice of using computational intelligence for expensive optimization problems A Collection of Technical Papers, 1991 **NASA SP.**, 1992 *Energy-Efficient Driving of Road Vehicles* Antonio Sciarretta, Ardalan Vahidi, 2019-08-01 This book elaborates the science and engineering basis for energy efficient driving in conventional and autonomous cars After covering the physics of energy efficient motion in conventional hybrid and electric powertrains the book chiefly focuses on the energy saving potential of connected and automated vehicles It reveals how being connected to other vehicles and the infrastructure enables the anticipation of upcoming driving relevant factors e g hills curves slow traffic state of traffic signals and movements of nearby vehicles In turn automation allows vehicles to adjust their motion more precisely in anticipation of upcoming events and to save energy Lastly the energy efficient motion of connected and automated vehicles could have a harmonizing effect on mixed traffic leading to additional energy savings for neighboring vehicles Building on classical methods of powertrain modeling optimization and optimal control the book further develops the theory of energy efficient driving In addition it presents numerous theoretical and applied case studies that highlight the real world implications of the theory developed The book is chiefly intended for undergraduate and graduate engineering students and industry practitioners with a background in mechanical electrical or automotive engineering computer science or robotics Mass Transit, 1988 Marine Engineers Review, 2001 **Paper**, 1987 **Anais Do IV**
