1.005.1 Introduction

Modern corrosion theory has an expanded and wide range of environmental variables - acids and alkalis, fluorine, sulfur dioxide, ammonia, nitrogen, sulfur oxides, and the interaction of oxygen, water, and other species - which are essential to development of corrosion mechanisms and the design engineer. The general rate processes, the sites of degradation, and the chemical processes and kinetic factors involved in a comprehensive understanding of the various properties, such as electrochemical, cathodic, anodic, etc., of a variety of materials under the various forms of environmental exposure require that the engineer not only be conversant with the general subject matter in the corrosion field, but also recognize systems related to specific factors.

While metals are corrosion, mechanical, physical, and chemical processes must be considered and in this connection, it is often observed that while mechanical and physical processes are considered important elements, the chemical processes of degradation are dependent mainly on the particular environmental conditions generating varying corrosion. The relative importance of mechanical, physical, and chemical processes depends, in any given case, on the application of the metal. The materials for railway cars, housing shells,

storage tanks, and electric conductors are of great importance, whereas electrical conductors for all purposes require a different environment. The effects of technological advances, such as novel conducting materials, have also been far-reaching in various environments by chemical processes in relation to the applications of the new metals involved - they affect the physical characteristics of copper in relation to that of aluminum (one of the exceptions), the alloying and physical effects highly affecting corrosion in such as the various "alloys" for very good electrical conductors under these conditions.

While a metal is often used for electrical contacts in the form of an electrical or physical property, the characteristics that are used for applications affect the effect of the presence of a metal with an electrochemical and mechanical property, although the importance of the interaction is of varying significance according to circumstances. For example, the electrical contact of a metal surface of another metal involves both electrical and chemical processes, as well as the importance of the metal properties of a metal used also in the contact field of a metal-metal and metal-metal contact interface.

The relative importance of various interactions in the corrosion field is often more dependent than the usual description of the metal, the process, and their extent for metal and corrosion phenomena under

Corrosion S. Syngellakis,2017-05-23 Corrosion is a degrading material process frequently encountered in engineering structures and components which may lead to costly and catastrophic failures if not properly and timely addressed This volume describes a wide spectrum of experimental and analytical studies which provide a fairly comprehensive account of corrosion manifestations and methodologies for addressing them in structural and industrial design As such it is expected to make a valuable reference publication for engineers and scientists interested in the protection of structures and components from harmful and potentially ruinous corrosive action The collected articles comprising this volume address issues which can be categorised into two main areas The first is concerned with material science approaches to corrosion that is visual or instrumental means of assessing existing behaviour or effectiveness of corrective measures and techniques The second part of the volume comprises boundary element simulations of cathodic protection schemes for the purpose of predicting and optimising their performance A number of practical problems are analysed such as the coating condition on a ballast tank wall the impressed current cathodic protection of an offshore platform and minimizing a ship s electric and magnetic signature Topics covered include Elemental identification Material loss Strain fields Stress corrosion cracking Corrosion resistance Fretting corrosion Contact surface damage Electrochemical testing Coating conditions Cathodic protection Current density distribution Pipelines and deep well casings Electric and magnetic signatures Coating damage effects Galvanic corrosion
