the passage of materials. The stomatal pores are surrounded on both sides by polysaccharide-chaperon cells called guard cells. Unlike other epidermal epidermal cells, the guard cells contain chloroplasts in the photosynthetic. This allows the cells to regulate themselves. The epidermal cells are about five micrometers. Guard cells are about 10 micrometers. This helps reduce the loss of water evaporation. This opening or closing of guard cells can be changed in a number of ways including different water potentialities in the leaf tissue.

Most stomata are on the lower epidermis of the leaves on plants. However, in some plants, the stomata are on the upper epidermis. Stomata close with time in hot, dry, or high light conditions. A high concentration of abscisic acid (ABA) is produced in the roots of plants under stress and it travels back to the stomata where it causes them to close. Stomata also close in response to high concentrations of carbon dioxide in the atmosphere. This is a feedback mechanism to prevent the plant from losing too much water.
