ABSTRACT

Through cross-site authentication schemes such as OAuth and OpenID, users increasingly rely on popular social networking sites for their digital identities—but use of these identities brings privacy and tracking risks. We propose Crypto-Book, an extension to existing digital identity infrastructures that offers privacy-preserving, digital identities through the use of public key cryptography and ring signatures. Crypto-Book builds a privacy-preserving cryptographic layer atop existing social network identities, via third-party *key servers* that convert social network identities into public/private key-pairs on demand. Using linkable ring signatures, these key-pairs along with the public keys of other identities create unique pseudonyms untraceable back to the owner yet can resist anonymous abuse.

Our proof-of-concept implementation of Crypto-Book creates public/private key pairs for Facebook users, and includes a private key pickup protocol based on E-mail. We present Black Box, a case study application that uses Crypto-Book for accountable anonymous whistle-blowing. Black Box allows users to sign files deniably using ring signatures, using a list of arbitrary Facebook users – who need not consent or even be aware of this use – as an explicit anonymity set.

1. INTRODUCTION

Social networks have gained widespread popularity among users as a means to managing their online identity; however, growing concern exists regarding online privacy. The extensive deployment of cross site authentication protocols such as OAuth [12] and OpenID [24] have simplified the processing of managing online identity across multiple sites. The unfortunate side effect, enables a user's online activity to be tracked more easily presenting a greater risk to online privacy.

We propose to leverage popular existing social network identities such as Facebook, but augment them with an additional cryptographic layer that enables more privacy-preserving uses of these existing identities. We distribute this privacy-preserving layer through one or more *key servers*, which could in principle be run either by the social networking sites themselves or by independent third-party organizations. These key servers convert social network identities into public/private key-pairs. Users can then employ these keypairs in privacy-preserving, anonymous cryptographic protocols, through the use of ring signatures [26, 18] for example. We demonstrate these capabilities via Black Box, a case study for a deniable whistleblowing application.

We use an *anytrust* [33] (see Section 3.1) cloud of key servers that collaboratively assign key pairs to each social network identity. Users need only assume that at least one of these key servers is trustworthy, but need not know or care which one. All the other servers may be compromised without breaking the user's privacy protection. Users obtain their private key by authenticating with each of the key servers via OAuth. Each key server generates only one part of the user's private key; the user's client machine then combines these parts to obtain his full private key.

Any user can on demand request not only his own but any set of other users' public keys from these key servers. The public keys can then be used in arbitrary privacy-preserving cryptographic protocols that rely on public/private keypairs. In Crypto-Book, for example, a user can request several others' public keys from the key servers, then use these public keys together with his

Cryptocurrencies and Blockchain Technology Applications Gulshan Shrivastava, Dac-Nhuong Le, Kavita Sharma, 2020-05-26 As we enter the Industrial Revolution 4.0 demands for an increasing degree of trust and privacy protection continue to be voiced. The development of blockchain technology is very important because it can help frictionless and transparent financial transactions and improve the business experience which in turn has far-reaching effects for economic, psychological, educational, and organizational improvements in the way we work, teach, learn, and care for ourselves and each other. Blockchain is an eccentric technology but at the same time the least understood and most disruptive technology of the day. This book covers the latest technologies of cryptocurrencies and blockchain technology and their applications. This book discusses the blockchain and cryptocurrencies-related issues and also explains how to provide the security differently through an algorithm framework, approaches, techniques, and mechanisms. A comprehensive understanding of what blockchain is and how it works, as well as insights into how it will affect the future of your organization and industry as a whole and how to integrate blockchain technology into your business strategy. In addition, the book explores the blockchain and its relationship with other technologies like Internet of Things, big data, and artificial intelligence etc. **Artificial Intelligence Using Federated Learning** Ahmed A. Elngar, Diego Oliva, Valentina E. Balas, 2024-12-30 Federated machine learning is a novel approach to combining distributed machine learning, cryptography, security, and incentive mechanism design. It allows organizations to keep sensitive and private data on users or customers decentralized and secure, helping them comply with stringent data protection regulations like GDPR and CCPA. Artificial Intelligence Using Federated Learning: Fundamentals, Challenges, and Applications enables training AI models on a large number of decentralized devices or servers, making it a scalable and efficient solution. It also allows organizations to create more versatile AI models by training them on data from diverse sources or domains. This approach can unlock innovative use cases in fields like healthcare, finance, and IoT where data privacy is paramount. The book is designed for researchers working in Intelligent Federated Learning and its related applications, as well as technology development, and is also of interest to academicians, data scientists, industrial professionals, researchers, and students.
