Abstract: This paper presents a review of the most popular approaches for decision tree induction. We present the various approaches as if in parallel, but acknowledge their differences, and then discuss their trade-offs with the aim of providing a practical way to compare them. This paper presents an updated version of the paper published in *Artificial Intelligence Magazine* in a regular column. The original version, a revised, updated, annotated, and annotated version of the original, is available at [http://www.berkeley.edu/~engd/engd/papers/decision\\_trees.pdf](http://www.berkeley.edu/~engd/engd/papers/decision_trees.pdf).

### 1.1.1.1.1.1.5. Decision Trees

A decision tree is a structure representing an inductive generalization of the target space. The structure uses conditions of nodes that form a nested tree, starting at a root node with a node called "root" that has two outgoing edges. All other nodes have exactly two outgoing edges. A node with outgoing edges is called an internal or test node. All other nodes are called leaves. Nodes are arranged in a hierarchy, starting at the root node and ending at a leaf node. The structure of the target space is represented by a nested tree, starting at the root node and ending at a leaf node. The structure of the target space is represented by a nested tree, starting at the root node and ending at a leaf node. The structure of the target space is represented by a nested tree, starting at the root node and ending at a leaf node.
