

Preparation of Soluble Salts

By Neutralization

25.0cm³ acid, as standard solution, is placed in conical flask using pipette. Add few drops of indicator & titrate with alkali from burette until indicator changes colour, showing all acid has just reacted. Volume of alkali added is measured. Prepare new 25.0cm³ acid again with pipette & add same volume of alkali as before to prevent excess alkali/acid because both reactant & product are aqueous. Next, the product is evaporated to dryness to obtain the salt.

1. Prepare a standard 25.0 cm³ of acid solution and a standard 25.0 cm³ of alkali solution. In fact, about 10% excess of alkali is used.
2. The experiment is now repeated. 25.0 cm³ of acid is added to a conical flask and titrated. The volume of alkali required to produce a colour change is noted. The same volume of alkali is added to the conical flask containing 25.0 cm³ of acid.
3. The product solution is evaporated to dryness on a water bath and crystallized.

By Reacting Metal with Acid

1. Add an excess of metal to acid slowly to prevent spilling, and continue to stir the mixture. The reaction will stop. There is excess metal present.

2. Remove the metal strip slowly and filter the mixture. The residue is washed with water.

3. Place the contents of your beaker on a water bath that will heat to approximately 60°C of the water. The products will be obtained as a solid residue. Wash the residue in water.

4. Place the filtrate in a beaker and by heat to evaporate most of the water. The crystals are then filtered and squeezed between filter papers to dry.

Only metals like zinc and magnesium, which moderately react with dilute acids, are used.

E.g. Reacting Zn with H₂SO₄ to prepare ZnSO₄

Zn is added to H₂SO₄ until in excess to ensure no more H₂SO₄ is present. Then the mixture is filtered off to separate Zn from ZnSO₄. The filtrate (ZnSO₄) is then placed in evaporating dish to evaporate most of water then it's cooled after ZnSO₄ crystals are formed. The crystals then filtered and squeezed between filter papers to dry.

By Reacting Insoluble Base with Acid

E.g. Reacting MgO with Acids

The same method as reaction of acid with metal is used, so refer to diagram and above explanation, substituting reactants and products.

By Reacting Carbonate with Acid

E.g. Reacting CaCO₃ with Acids

The same process is used as reaction of acid with metal, just that carbon dioxide is produced. Carbon dioxide can be tested by bubbling it into limewater which will turn limewater colourless to milky.

7.4 Properties and Uses of Ammonia

Ammonia and its Uses

Are produced from nitrogen reacted with hydrogen for producing: fertilisers, nitric acid, nylon, dyes, cleaners and dry cell

The Manufacture of Ammonia: The Haber Process

The Process

Nitrogen and hydrogen are mixed together in ratio 1:3, where nitrogen is obtained from air and hydrogen is obtained from natural gas, and passed over iron-catalyst.

O Level Chemistry Notes Studyguide Pk
