### PLAYGROUND DESIGNER

**PERFORMANCE TASK**

**OVERVIEW**

You will step into the shoes of a playground designer. Your school has decided to build a new playground with a unique geometric structure. As the lead designer, you have been tasked with determining the measures of various angles to ensure the safety and functionality of the design.

**TASK #1**

Imagine you are designing a new playground for your school; the playground will have a unique geometric structure, and you have been tasked with determining the measures of various angles to ensure the safety and functionality of the design. In the playground design, there are four angles labeled as A, B, C, and D. You know that:

- Angle A is a right angle (90 degrees).
- Angle B is a supplementary angle to Angle C.
- Angle D is a complementary angle to Angle C.

To find the measures of angles B, C, and D, you need to set up and solve equations based on the given information.

Write an equation to find each angle.

**TASK #2**

Solve each equation that you wrote in task #1 to find the measure of each angle. (Note: Angle C is 40 degrees.)

### PLAYGROUND DESIGNER

**PERFORMANCE TASK**

**TASK #3**

Now that you have found the measures of angles B, C, and D, determine if they add up to form a complete angle (360 degrees) or not. Explain your findings.

**TASK #4**

Within the playground structure, there are vertical angles formed. Identify the pairs of vertical angles and calculate their measures based on the information you have.

**Predicting Room of Origin Fire Hazards** The Society of Fire Protection Engineers, 2022-08-13 This engineering guide provides a methodology to define and quantify the fire development and ensuing conditions within the room of fire origin from the fire's incipient stage through its full development. The approach presented in this guide was developed using the framework set forth in the SFPE Engineering Guide to Performance Based Fire Protection 2nd ed Quincy Mass National Fire Protection Association 2007 It consists of three distinct parts: 1 Approach selection, 2 Input definition and data collection, 3 Results computation. Specifically, this guide was developed for use as a means to implement the requirements presented in Chapter 10 of the SFPE Engineering Guide to Performance Based Fire Protection. However, material within this guide has broader applicability and is therefore not limited to performance based design applications. *Publication - National Academy of Sciences-National Research Council, 1961*

**Analog Layout Generation for Performance and Manufacturability** Koen Lampaert, Georges Gielen, Willy Sansen, 1999-04-30 Analog integrated circuits are very important as interfaces between the digital parts of integrated electronic systems and the outside world. A large portion of the effort involved in designing these circuits is spent in the layout phase. Whereas the physical design of digital circuits is automated to a large extent, the layout of analog circuits is still a manual, time-consuming, and error-prone task. This is mainly due to the continuous nature of analog signals which causes analog circuit performance to be very sensitive to layout parasitics. The parasitic elements associated with interconnect wires cause loading and coupling effects that degrade the frequency behaviour and the noise performance of analog circuits. Device mismatch and thermal effects put a fundamental limit on the achievable accuracy of circuits. For successful automation of analog layout, advanced place and route tools that can handle these critical parasitics are required. In the past, automatic analog layout tools tried to optimize the layout without quantifying the performance degradation introduced by layout parasitics. Therefore, it was not guaranteed that the resulting layout met the specifications and one or more layout iterations could be needed. In *Analog Layout Generation for Performance and Manufacturability*, the authors propose a performance-driven layout strategy to overcome this problem. In this methodology, the layout tools are driven by performance constraints such that the final layout, with parasitic effects still satisfies the specifications of the circuit. The performance degradation associated with an intermediate layout solution is evaluated at runtime using predetermined sensitivities. In contrast with other performance-driven layout methodologies, the tools proposed in this book operate directly on the performance constraints without an intermediate parasitic constraint generation step. This approach makes a complete and sensible trade-off between the different layout alternatives possible at runtime and therefore eliminates the possible feedback route between constraint derivation, placement, and layout extraction. Besides its influence on the performance layout, it also has a profound impact on the

yield and testability of an analog circuit In Analog Layout Generation for Performance and Manufacturability the authors outline a new criterion to quantify the detectability of a fault and combine this with a yield model to evaluate the testability of an integrated circuit layout They then integrate this technique with their performance driven routing algorithm to produce layouts that have optimal manufacturability while still meeting their performance specifications Analog Layout Generation for Performance and Manufacturability will be of interest to analog engineers researchers and students Scott
