

Medical Textiles: Application of Implantable Medical Textiles

Shah Md. Masud Hasan ¹, Md. Shahjalal ², Jagul Hoque Mridha ³ & A. M. Rezaul Alam ^{1*}

Abstract: The use of textiles in the medical sector is increasing day by day. An important and emerging part of the textile industry is medical, hygiene and health care sector. Textiles are a compelling solution for implantable medical devices, primarily due to the versatility they offer in product design. Textiles are in 2D and 3D implantable forms, with configurations limited only by the imagination. The number of applications is enormous and diverse, ranging from a single thread suture to the complex composite structures for bone replacement and from the simple cleaning wipe to advanced barrier fabrics used in Operation Theater. The main object of this work is to study the types of implantable textiles used in the medical sector such as surgical suture, artificial skin, artificial ligament, and artificial cartilage. In this study, we have included different types of raw materials used and the manufacturing process of these implantable medical textiles.

Keywords: implantable materials, non-implantable materials, chitin, collagen, ECM, ACE, heparinase.

I. INTRODUCTION

Medical textiles are also known as healthcare textiles. The medical textile industry has diversified with new materials and innovative designs. Evolving polymer technology has yielded a wide range of applications of implantable medical textile devices. The Medical textile products are obtainable in woven, knitted and non-woven structure based on the area of application. Increasingly, synthetic fiber is being utilized in the manufacturing of these products.

Medical Textiles are defined in various ways, according to David Rigby Associates.

"The Medical Textile or Meditech application area embraces all those technical textiles used in health and hygiene products"

"Textile Terms & Definitions" defines Medical Textiles as - "A general term which describes a textile structure which has been designed and produced for use in any of a variety of medical applications, including implantable applications."

II. CLASSIFICATION OF MEDICAL TEXTILES

a) Non-implantable materials

These materials use in external application on the body and may or may not make contact with the skin.

b) Implantable materials

These materials used in effecting a repair to the body whether it be wound closure (sutures) or replacement surgery (vascular grafts, artificial ligaments, artificial cartilage, etc.).

c) Extracorporeal devices

These are extra corporeally mounted devices used to support the function of vital organs, such as kidney, liver, lung, heart pacer, etc. The extracorporeal devices are mechanical organs that are used for blood purification and include the artificial kidney (dialyser), the artificial liver, and the mechanical lung. The function and performance of these devices benefit from fiber and textile technology.

d) Healthcare/hygiene products

Healthcare and hygiene products are a rising sector in the field of medicine and surgery. The range of products available is vast, but typically they are used either in the operating theatre or on the hospital ward for the hygiene, care, and safety of staff and patients.
