Woodward, Bivin Philip Sadler, Stephen Robertson, 2022-08-01 Data Science students and practitioners want to find a forecast that works and don't want to be constrained to a single forecasting strategy Time Series for Data Science Analysis and Forecasting discusses techniques of ensemble modelling for combining information from several strategies Covering time series regression models exponential smoothing Holt Winters forecasting and Neural Networks It places a particular emphasis on classical ARMA and ARIMA models that is often lacking from other textbooks on the subject This book is an accessible guide that doesn't require a background in calculus to be engaging but does not shy

away from deeper explanations of the techniques discussed Features Provides a thorough coverage and comparison of a wide array of time series models and methods Exponential Smoothing Holt Winters ARMA and ARIMA deep learning models including RNNs LSTMs GRUs and ensemble models composed of combinations of these models Introduces the factor table representation of ARMA and ARIMA models This representation is not available in any other book at this level and is extremely useful in both practice and pedagogy Uses real world examples that can be readily found via web links from sources such as the US Bureau of Statistics Department of Transportation and the World Bank There is an accompanying R package that is easy to use and requires little or no previous R experience The package implements the wide variety of models and methods presented in the book and has tremendous pedagogical use

Introduction to Time Series and Forecasting Peter J. Brockwell, Richard A. Davis, 2013-03-14 Some of the key mathematical results are stated without proof in order to make the underlying theory accessible to a wider audience The book assumes a knowledge only of basic calculus matrix algebra and elementary statistics The emphasis is on methods and the analysis of data sets The logic and tools of model building for stationary and non stationary time series are developed in detail and numerous exercises many of which make use of the included computer package provide the reader with ample opportunity to develop skills in this area The core of the book covers stationary processes ARMA and ARIMA processes multivariate time series and state space models with an optional chapter on spectral analysis Additional topics include harmonic regression the Burg and Hannan Rissanen algorithms unit roots regression with ARMA errors structural models the EM algorithm generalized state space models with applications to time series of count data exponential smoothing the Holt Winters and ARAR forecasting algorithms transfer function models and intervention analysis Brief introductions are also given to cointegration and to non linear continuous time and long memory models The time series package included in the back of the book is a slightly modified version of the package ITSM published separately as ITSM for Windows by Springer Verlag 1994 It does not handle such large data sets as ITSM for Windows but like the latter runs on IBM PC compatible computers under either DOS or Windows version 3.1 or later The programs are all menu driven so that the reader can immediately apply the techniques in the book to time series data with a minimal investment of time in the computational and algorithmic aspects of the analysis
