Classical Analogies in the Solution of Quantum Many-Body Problems Aydın Cem Keser, 2018-11-07 This book addresses problems in three main developments in modern condensed matter physics namely topological superconductivity many body localization and strongly interacting condensates superfluids by employing fruitful analogies from classical mechanics This strategy has led to tangible results firstly in superconducting nanowires the density of states a smoking gun for the long sought Majorana zero mode is calculated effortlessly by mapping the problem to a textbook level classical point particle problem Secondly in localization theory even the simplest toy models that exhibit many body localization are mathematically cumbersome and results rely on simulations that are limited by computational power In this book an alternative viewpoint is developed by describing many body localization in terms of quantum rotors that have incommensurate rotation frequencies an exactly solvable system Finally the fluctuations in a strongly interacting Bose condensate and superfluid a notoriously difficult system to analyze from first principles are shown to mimic stochastic fluctuations of space time due to quantum fields This analogy not only allows for the computation of physical properties of the fluctuations in an elegant way it sheds light on the nature of space time The book will be a valuable contribution for its unifying style that illuminates conceptually challenging developments in condensed matter physics and its use of elegant mathematical models in addition to producing new and concrete results Acta Physica Hungarica ,1974 **American Journal of Physics** ,1986 Archival journal targeted toward advanced level physics and physics education with its focus on the teaching and cultural aspects of physics

and the latter to the metaplectic group In a like manner the Wigner function is introduced by following the original issue to individualize a phase space representation of quantum mechanics which is mirrored by the issue to individualize a local frequency spectrum within the signal theory context The basic analogy with the optics of charged particles inherently underlying the ray optics picture in phase space is also evidenced within the wave optics picture in the Wigner phase space amalgamation of a great deal of contributions having witnessed the phase space picture of optics over the past 30 years introduces abstract concepts through concrete systems hosts of figures and logical diagrams to favour intuition and to introduce mathematics emphasis on the interrelations with quantum optics signal theory and magnetic optics feeds a feeling for genuine issues in higher mathematics and theoretical physics

Statistical Mechanics Richard E. Wilde, Surjit Singh, 1998 A valuable learning tool for students and an indispensable resource for professional scientists and engineers Several outstanding features make this book a superior introduction to modern statistical mechanics It is the only intermediate level text offering comprehensive coverage of both basic statistical mechanics and modern topics such as molecular dynamic methods renormalization theory chaos polymer chain folding oscillating chemical reactions and cellular automata It is also the only text written at this level to address both equilibrium and nonequilibrium statistical mechanics Finally students and professionals alike will appreciate such aids to comprehension as detailed derivations for most equations more than 100 chapter end exercises and 15 computer programs written in FORTRAN that illustrate many of the concepts covered in the text Statistical Mechanics begins with a refresher course in the essentials of modern statistical mechanics which on its own can serve as a handy pocket guide to basic definitions and formulas Part II is devoted to equilibrium statistical mechanics Readers will find in depth coverage of phase transitions critical phenomena liquids molecular dynamics Monte Carlo techniques polymers and more Part III focuses on nonequilibrium statistical mechanics and progresses in a logical manner from near equilibrium systems for which linear responses can be used to far from equilibrium systems requiring nonlinear differential equations
