European Symposium on Computer Aided Process Engineering M. Gądek, R. Kubica, E. Jędrzyk, 2013-06-10 Increasing awareness of the environmental issues forces a strong drive towards the development of new sustainable processes for renewable energy production Likewise the economic issues related to the increasing prices of crude oil and its derivatives lead to the recognition of advantages of alternative fuels thus a significant interest in biomass derived synthetic fuels is observed Among various thermo chemical conversion processes biomass gasification is one of the most effective efficient and sustainable solutions to the production of renewable energy It provides a gaseous fuel composed mainly of carbon monoxide and hydrogen suitable to produce chemicals heat and energy In particular syngas can be used to obtain methanol MeOH and dimethyl ether DME both energy carriers of great interest for many advanced energy applications The herein presented work provides the reader with a comparison of the technicalities as well as economics of methanol and DME production from biomass derived syngas by different pathways For that purpose a process simulation by means of the ChemCAD commercial code was used The developed simulation strategies include both optimization of the kinetic models and unique solution of fuel refinement 27th European Symposium on Computer Aided Process Engineering ,2017-09-21 27th European Symposium on Computer Aided Process Engineering Volume 40 contains the papers presented at the 27th European Society of Computer Aided Process Engineering ESCAPE event held in Barcelona October 1 5 2017 It is a valuable resource for chemical engineers chemical process engineers researchers in industry and academia students and consultants for chemical industries Presents findings and discussions from the 27th European Society of Computer Aided Process Engineering ESCAPE event **23rd European Symposium on Computer Aided Process Engineering** ,2013-06-10 Computer aided process engineering CAPE plays a key design and operations role in the process industries from the molecular scale through managing complex manufacturing sites The research interests cover a wide range of interdisciplinary problems related to the current needs of society and industry ESCAPE 23 brings together researchers and practitioners of computer aided process engineering interested in modeling simulation and optimization synthesis and design automation and control and education

Simulation and Techno-Economic Analysis of the AChT Green Methanol Process Sean McCaul, 2019 Methanol is a valuable commodity with many uses It is used to manufacture other chemicals such as olefins formaldehyde and methyl tert

butyl ether MTBE Methanol is also being researched as an alternative fuel for vehicles Global methanol demand is increasing making it a valuable chemical to manufacture Methanol production requires three main steps syngas production methanol production and methanol purification Syngas is a mix of carbon monoxide and hydrogen that can be made through the reforming of natural gas The production of syngas is done through many methods Three primary methods are steam methane reforming SMR partial oxidation POX and autothermal reforming ATR Once syngas is produced it is sent to a methanol reactor where three main reactions occur the hydrogenation of CO the hydrogenation of CO₂ and the water gas shift reaction A product stream with methanol is then purified in using distillation The company Technology Convergence Inc TCI made a process for manufacturing methanol in 2004 called the Green Methanol Process This process involved the use of a POX reformer and an electrolyser to provide the required hydrogen and oxygen TCI is now known as Advanced Chemical Technologies AChT and they have since updated their Green Methanol Process The new process still uses an electrolyser to generate hydrogen and oxygen but now uses an ATR for syngas production Aspen Plus was used in this work to simulate the updated AChT process Heat integration was successfully implemented into the simulation Additionally the syngas production method was changed over from POX to ATR An initial analysis of the amine reboiler of a CO₂ capture unit was done Finally it was discovered that the waste stream contained a large amount of hydrogen To remedy this a method of hydrogen purification was studied called pressure swing adsorption PSA A version of the methanol process simulation was done with the PSA hydrogen recycle system added An economic analysis looked into the OPEX and CAPEX of the process with and without PSA hydrogen recycling Without hydrogen recycling the CAPEX and OPEX were found to be 248 CAD metric tonne MT methanol and 300 CAD MT methanol respectively while producing 217 MTPD metric tonne per day of methanol This resulted in a combined overall cost of 548 CAD MT methanol produced With hydrogen recycling the CAPEX and OPEX were found to be 223 CAD MT methanol and 280 CAD MT methanol respectively while producing 249 MTPD of methanol This resulted in a combined cost of 503 CAD MT methanol Overall it was found that the implementation of a PSA hydrogen recycle system was a good investment Additionally hourly Ontario electricity price HOEP data from 2018 were used to determine on average the most expensive consecutive 11 day period Since the plant was planned to be shut down for 11 days for maintenance this would inform when the best time to shut down would be to save the most on electricity The best day to start the maintenance was found to be January 5th The next most expensive periods started on December 4th and April 9th
