Meriam, L. G. Kraige, 2012-03-19 The 7th edition continues to provide the same high quality material seen in previous editions It provides extensively rewritten updated prose for content clarity superb new problems in new application areas outstanding instruction on drawing free body diagrams and new electronic supplements to assist learning and instruction *Schaum's Outline of Theory and Problems of Engineering Mechanics* William G. McLean, Eric William Nelson, 1988 Engineering Mechanics Bela I. Sandor, Karen J. Richter, 1987 *Dynamic Analysis of Robot Manipulators* Constantinos A. Balafoutis, Rajnikant V. Patel, 2012-12-06 The purpose of this monograph is to present computationally efficient algorithms for solving basic problems in robot manipulator dynamics In particular the following problems of rigid link open chain manipulator dynamics are considered i computation of inverse dynamics ii computation of forward dynamics and iii generation of linearized dynamic models Computationally efficient solutions of these problems are prerequisites for real time robot applications and simulations Cartesian tensor analysis is the mathematical foundation on which the above mentioned computational algorithms are based In particular it is shown in this monograph that by exploiting the relationships between second order Cartesian tensors and their vector invariants a number of new tensor vector identities can be obtained These identities enrich the theory of Cartesian tensors and allow us to manipulate complex Cartesian tensor equations effectively Moreover based on these identities the classical vector description for the Newton Euler equations of rigid body motion are rewritten in an equivalent tensor formulation which is shown to have computational advantages over the classical vector formulation Thus based on Cartesian tensor analysis a conceptually simple easy to implement and computationally efficient tensor methodology is presented in this monograph for studying classical rigid body dynamics XII Application of this tensor methodology to the dynamic analysis of rigid link open chain robot manipulators is simple and leads to an efficient formulation of the dynamic equations of motion Video Data Compression for Multimedia Computing Hua Harry Li, Shan Sun, Haluk Derin, 2012-12-06 During the past few years we have been witnessing the rapid growth of the applications of Interactive Digital Video Multimedia Computing Desktop Video Teleconferencing Virtual Reality and High Definition Television HDTV An other information revolution which is tied to Cyberspace is almost within reach The

information data text graphics video sound etc in the form of multi media can be requested accessed distributed and transmitted to potentially every household This is changing and will continue to change the way of people doing business functioning in the society and entertaining In the foreseeable future many personalized portable information terminals which can be carried while traveling will provide the link to central computer network to allow information exchange including videos from a node to node from a center to a node or nodes Facing this opportunity the question is what are the major significant technical challenges that people have to solve to push the state of the art for the realization of the above mentioned technology advancement From our professional judgement We feel that one of the major technical challenges is in Video Data Compression Video communications in the form of desktop teleconferencing videophone network video delivery on demand even games are going to be major media traveling in the information super highway hopping from one node in the Cyberspace to the other
