Nomenclature Rules

Function and variable names can consist of any alphanumeric character, $ and _ are allowed. The first character cannot be numeric. Many extended ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name the last declaration obliterates all previous ones. Using a keyword as a variable or function name obliterates that keyword.

Visibility & Scope

Assignments without the use of the **var** keyword result in a new global variable of that name being created.

Variables declared with the **var** keyword outwith the body of a function are global. Variables declared with the **var** keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

Variable Types

string: **var** s = "explainthat" or 'explainthat'
number: **var** n = 3.141599, 100, 0...
boolean: **var** flag = false or true
object: **var** d = new Date();
function: var Great = function sayHello() {alert('Hello')}

JavaScript is a weakly typed language — i.e. a simple assignment is sufficient to change the variable type. The **typeof** keyword can be used to check the current variable type.

Special Values

The special values false, Infinity, NaN, null, true & undefined are recognized. null is an object. Infinity and NaN are numbers.
