Abstract

Background: The acquisition of Q, R, and S peaks (QRS) complex detection is a crucial procedure in electrocardiogram (ECG) processing and analysis. We propose a novel algorithm for QRS complex detection based on the dynamic time warping (DTW) algorithm with the addition of some constraints. This paper considers that signals can be used for detecting QRS complex and representing normal ECG signals. A QRS is considered to be a pair of adjacent peaks which meet the four criteria of standard deviation and duration.

Results: The proposed method was applied on several trials of ECG signals received from the standard MIT-BIH arrhythmia database. A total of 40 signals were used. For an input signal, several parameters were determined such as QRS duration, RR distance, and the peak amplitude. RR and rRRS parameters were added to quantify the regularity of RR distance and QRS duration, respectively. The sensitivity of the suggested method was 99.74% and the specificity was 99.94%. Moreover, the sensitivity and the specificity rates according to the topographic maps were very promising.

Conclusions: Regular grammar with the addition of some constraints and additional rules summarizes a novel algorithm for ECG signal processing. Compared to traditional methods, the use of grammar provides satisfactory and competitive results and it is also more comparable to or more better than those used in the literature.

Background

The acquisition of Q, R, and S peaks complex detection is one of the most frequently addressed tasks in ECG signal processing and analysis. A wide range of methods allowing high detection rates have been proposed and used [1–4]. Nevertheless, the problem remains open since the variety of ECG signals and the noise that might impact them. These methods include the Sugiura Vector Matching (SVM) [5–10], the fuzzy neural networks [11–14] and the wavelets [1, 17–24]. Saha et al. [15, 16] utilized the first-order derivatives of the Gaussian function as a window for the discrimination of ECG beats. The author used the dyadic wavelet transform to detect and measure the different parts of a signal, especially the duration of the beginning and the end of the QRS complex. Subsequently, it showed the robustness of the algorithm in the presence of a high-frequency noise added to the signal. In [1], a dyadic wavelet transform was used to extract

Real Time Matched Filter Detection of the QRS Complex by Replica Correlation, 1970 The report describes an approach to optimum detection of each cardiac cycle from noisy electrocardiograms A filter matched to the QRS complex of the electrocardiogram is proposed to achieve the results It is demonstrated analytically that such a filter yields the optimum signal to noise ratio obtainable in the presence of stationary Gaussian noise While this type of filtering is done on a digital computer and not in real time the advent of medium and large scale integrated circuit technology has made it feasible to implement a specific piece of hardware for this purpose Author *QRS Detection Using Automata Theory in a Battery-powered Microprocessor System* Gregory S. Furno, 1982 *An Efficient Algorithm for ECG Denoising and Beat Detection* Tarun Mani Tiwari, 2008

Due to physical variability of ECG waves detection of the QRS complex becomes a difficult task in a real time situation Jiau Pan and Willis J Tompkins of the University of Wisconsin developed a real time QRS detection algorithm for a Z 80 microprocessor They demonstrated a overall performance of 99.325% when tested against the MIT BIH arrhythmia database

Real-Time QRS Detection and Electrocardiogram Signal Compression Using Wavelet Based Subbands Asiya Mohamed Al-Busaidiyah, 2016 **QRS Detection Using Wavelet Transform** Anuja Nanavati, 2012

The electrocardiogram ECG provides information about the heart ECG is a biological signal which generally changes its physiological and statistical property with respect to time tending to be non stationary signal For studying such

types of signals wavelet transforms are very useful The most striking waveform when considering the ECG is the QRS wave complex which gives the R wave peak which is time varying This report describes an algorithm for detection of QRS complex using the Wavelet transform This detector is reliable to QRS complex morphology and properties which changes with time and also to the noise in the signal The performance of the Wavelet transform based QRS detector is illustrated by testing ECG signals from MIT Arrhythmia database We also compare the performance of Wavelet based QRS detector with detectors using Derivative based method From the comparison the Wavelet detector exhibited superior performance for different ECG signals like multiform premature ventricular contractions bigemy and noisy signals
