Multiple Choice

Identify the letter of the choice that best completes the statement or answers the question.

- Offspring that result from crosses between true-breeding parents with different traits
 - are true-breeding.
 - make up the F₂ generation.
 - make up the parental generation.
 - are called hybrids.
- Mendel concluded that traits are
 - not inherited by offspring.
 - inherited through the passing of factors from parents to offspring.
 - determined by dominant factors only.
 - determined by recessive factors only.
- When Mendel crossed true-breeding tall plants with true-breeding short plants, all the offspring were tall because
 - the allele for tall plants is recessive.
 - the allele for short plants is dominant.
 - the allele for tall plants is dominant.
 - they were true-breeding like their parents.
- In the P generation, a tall plant was crossed with a short plant. Short plants reappeared in the F₂ generation because
 - some of the F₂ plants produced gametes that carried the allele for shortness.
 - the allele for shortness is dominant.
 - the allele for shortness and the allele for tallness segregated when the F₁ plants produced gametes.
 - they inherited an allele for shortness from one parent and an allele for tallness from the other parent.
- The principles of probability can be used to
 - predict the traits of the offspring produced by genetic crosses.
 - determine the actual outcomes of genetic crosses.
 - predict the traits of the parents used in genetic crosses.
 - decide which organisms are best to use in genetic crosses.
- A Punnett square shows all of the following EXCEPT
 - all possible results of a genetic cross.

The Natural History of Inbreeding and Outbreeding Nancy Wilmsen Thornhill, 1993-08-15 Inbreeding the mating of close kin and outbreeding the mating of distant relatives or unrelated organisms have long been important subjects to evolutionary biologists Inbreeding reduces genetic diversity in a population increasing the likelihood that genetic defects will become widespread and deprive a population of the diversity it may need to cope with its environment Most plants and animals have evolved behavioral and morphological mechanisms to avoid inbreeding However today many endangered species exist only in small very isolated populations where inbreeding is unavoidable so it has become a concern for conservationists In this volume twenty six experts in evolution behavior and genetics examine the causes and consequences of inbreeding The authors ask whether inbreeding is as problematic as biologists have thought under what ecological conditions inbreeding occurs and whether organisms that inbreed have mechanisms to dampen the anticipated problems of reduced genetic variation The studies including theoretical and empirical work on wild and captive populations demonstrate that many plants

and animals inbred to a greater extent than biologists have thought with variable effects on individual fitness Graduate students and researchers in evolutionary biology animal behavior ecology and conservation biology will welcome this wide ranging collection PCAT Aftab S.
