required for a reader to understand the practice of evaluating forensic biology evidence given activity level propositions and to implement the practice into active casework within a forensic institution. The book begins by explaining basic concepts and foundational theory pulling together research and studies that have accumulated in forensic journal literature over the last 20 years. The book explains the laws of probability showing how they can be used to derive from first principles the likelihood ratio used throughout the book to express the strength of evidence for any evaluation. Concepts such as the hierarchy of propositions, the difference between experts working in an investigative or evaluative mode and the practice of case assessment and interpretation are explained to provide the reader with a broad grounding in the topics that are important to understanding evaluation of evidence. Activity level evaluations are discussed in relation to biological material transferred from one object to another, the ability for biological material to persist on an item for a period of time or through an event, the ability to recover the biological material from the object when sampled for forensic testing, and the expectations of the prevalence of biological material on objects in our environment. These concepts of transfer, persistence, prevalence, and recovery are discussed in detail in addition to the factors that affect each of them. The authors go on to explain the evaluation process, how to structure case information, and formulate propositions. This includes how a likelihood ratio formula can be derived to evaluate the forensic findings, introducing Bayesian networks and explaining what they represent and how they can be used in evaluations, and showing how evaluation can be tested for robustness. Using these tools, the authors also demonstrate the ways that the methods used in activity level evaluations are applied to questions about body fluids. There are also chapters dedicated to reporting of results and implementation of activity level evaluation in a working forensic laboratory. Throughout the book, four cases are used as examples to demonstrate how to relate the theory to practice and detail how laboratories can integrate and implement activity level evaluation into their active casework.

**Handbook on Teaching Undergraduate Science Courses** Gordon Uno, 1999. This already popular teaching resource is an informative, insightful guide to science teaching. The handbook places special emphasis on general biology, compiling materials collected and developed by Dr. Uno during his 17 years of teaching experience. Graduate teaching assistants, undergraduate science instructors, as well as experienced faculty members looking for new classroom ideas will find this guide an invaluable source of information.

**Biology: How Life Works (Volume 1)** James Morris, 2013-01-04. Ordinarily, textbooks are developed by first writing chapters, then making decisions about art and images, and finally, once the book is complete, assembling a test bank and ancillary media. This process dramatically limits the integration across resources and reduces art, media, and assessments to ancillary material rather than essential resources for student learning. *Biology: How Life Works* is the first project to develop three pillars: the text, the visual program, and the assessment, at the same time. All three pillars were developed in parallel to make sure that each idea is addressed in the most appropriate medium and to ensure authentic integration. These three pillars are all tied to the same set of core concepts, share a common language, and use the same

visual palette In this way the text visual program and assessments are integral parts of student learning rather than just accessories to the text
