

Biology – End of Chapter 16 Assessment Answers

1. C
2. A
3. Darwin observed that each of these distantly related large, flightless birds found in a different but ecologically similar habitat around the globe shared many similarities in form and function.
4. Closely related Galapagos tortoises exhibited different traits depending on the environment of the island where they lived.
5. Evolution means change over time. An example of evolution is the change over time in some bacteria that allows them to resist drugs.
6. Darwin's trip allowed him to observe, in a variety of habitats, patterns of biodiversity that result from evolution by natural selection.
7. Because some Australian habitats seemed to be ideal for rabbits, and similar grasslands in Europe had rabbits.
8. A
9. D
10. Geological processes uplifted a former sea bed to form mountains.
11. Lyell proposed that Earth is extremely old and processes that changed Earth in the past are still at work today. This allowed for the great time span Darwin believed was necessary for evolution to occur. It also provided a geological analogy for biological evolution.
12. According to Malthus, population growth is limited by overcrowding and lack of food, which in turn lead to war, famine, and disease. His ideas apply to other organisms better than to humans, because other organisms can produce many more offspring over their lifetimes than humans.
13. Artificial selection is the process of selectively breeding plants and animals to have the traits desired by breeders or farmers. Artificial Selection showed Darwin how heritable traits of organisms can change over time.
14. Like many other organisms, sunflowers produce far more seeds that can survive and grow into mature plants. Most of the seeds will not germinate or the plants they develop into will die before they reach maturity.
15. Lamrack was one of the first naturalists to suggest that species are not fixed, and he tried to explain evolution scientifically using natural processes. He also recognized that there is a link between an organism's environment and its body structure.
16. B
17. A
18. Variation is necessary if some organisms are to have greater fitness than others and to have a greater chance of passing on their traits to the next generation.
19. The statement means that living species descended, with modification, from common ancestors. This implies that all organisms are related if you go back far enough in time. In other words, a single "tree of life" links all living things.
20. For a natural selection to occur, there must be overproduction of offspring and variation among the heritable traits in organisms, and these variations must correlate to differences in fitness.
21. Darwin would explain the long legs of the water bird as an adaptation that evolved through natural selection. Lamrack would explain the long legs of the bird as an adaptation that evolved through the inheritance of acquired characteristics.
22. Fitness refers to how well an individual can survive and reproduce in its environment relative to other individuals of the same species. Adaptation refers to any heritable characteristic that increases an organism's fitness.
23. The Galapagos Islands varied in their environments, so organisms with different traits were better suited for different islands. Over time, natural selection for different traits on each island led to variation in the species.
