

CALCULUS

DIFFERENTIAL CALCULUS:

* $\lim_{x \rightarrow a} f(x) = L \rightarrow$ limit of a real function

* $\lim_{x \rightarrow a} f(x) = f(a) \rightarrow$ continuity of Real function

* $\frac{dy}{dx} = f'(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x) - f(x)}{\Delta x} \rightarrow$ derivative of real function

* $(f'(x))_{x=a} = f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$

* $\frac{\partial F}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x, y) - f(x, y)}{\Delta x}$

* $\frac{\partial F}{\partial y} = \lim_{\Delta y \rightarrow 0} \frac{f(x, y+\Delta y) - f(x, y)}{\Delta y}$

\rightarrow partial derivative

Maximum and Minimum values of $y = f(x)$:

* Substitute $f'(x) = 0$, then get the stationary points

* At any stationary points $f''(x) < 0$, we get max value of $f(x)$

At any stationary points $f''(x) > 0$, we get min value of $f(x)$

* If $f''(x) = 0$ at any stationary point then there is no max (or) min value of $f(x)$

* Among all max values and min values of $f(x)$ greatest value is called global max and smallest value is global minimum.

* If it is decided to find global max (or) global min of $f(x)$ in $[a, b]$ then we must consider function values $f(a)$ & $f(b)$ in addition to applying above procedure.

Maximum & Minimum values of Implicit function $F(x, y)$:

* Substitute $\frac{\partial F}{\partial x} = 0$ and $\frac{\partial F}{\partial y} = 0$ and get stationary or critical points.

* Calculate $r = \frac{\partial^2 F}{\partial x^2}$, $s = \frac{\partial^2 F}{\partial x \partial y}$, $t = \frac{\partial^2 F}{\partial y^2}$ at all stationary points.

* If $(rt - s^2) > 0$ & $r < 0 \rightarrow$ max value of $f(x, y)$

* If $(rt - s^2) > 0$ & $r > 0 \rightarrow$ min value of $f(x, y)$

* If $(rt - s^2) < 0 \rightarrow$ No max (or) min value of $f(x, y)$ and that point is called saddle point.

* If $(rt - s^2) = 0 \rightarrow$ Cannot give any conclusion.

* If $f(x)$ in $[a, b]$ given, a & b values substituted in $f(x)$ only in order to find the max and min values.

functions in CAS are limited to simple arithmetic expressions and are therefore insufficient for most use cases. Consequently, the workflow of experimenting and publishing in the Sciences often includes time-consuming and error-prone manual conversions between presentational LaTeX and computational CAS formats. To address the lack of a reliable and comprehensive translation tool between LaTeX and CAS, this thesis makes the following three contributions: First, it provides an approach to semantically enhance LaTeX expressions with sufficient semantic information for translations into CAS syntaxes. Second, it demonstrates the first context-aware LaTeX to CAS translation framework, LaCAST. Third, the thesis provides a novel approach to evaluate the performance for LaTeX to CAS translations on large scaled datasets with an automatic verification of equations in digital mathematical libraries. This is an open access book.

Autonomic Network Management Principles Nazim Agoulmine, 2010-12-03. Autonomic networking aims to solve the mounting problems created by increasingly complex networks by enabling devices and service providers to decide preferably without human intervention what to do at any given moment and ultimately to create self-managing networks that can interface with each other, adapting their behavior to provide the best service to the end user in all situations. This book gives both an understanding and an assessment of the principles, methods, and architectures in autonomous network management, as well as lessons learned from the ongoing initiatives in the field. It includes contributions from industry groups at Orange Labs, Motorola, Ericsson, the ANA EU Project, and leading universities. These groups all provide chapters examining the international research projects to which they are contributing, such as the EU Autonomic Network Architecture Project and Ambient Networks EU Project, reviewing current developments and demonstrating how autonomic management principles are used to define new architectures, models, protocols, and mechanisms for future network equipment. Provides reviews of cutting-edge approaches to the management of complex telecommunications, sensors, etc. networks based on new autonomic approaches. This enables engineers to use new autonomic techniques to solve complex distributed problems that are not possible or easy to solve with existing techniques. Discussion of FOCAL, a semantically rich network architecture for coordinating the behavior of heterogeneous and distributed computing resources. This provides vital information since the data model holds much of the power in an autonomic system, giving the theory behind the practice which will enable engineers to create their own solutions to network management problems. Real case studies from the groups in industry and academia who work with this technology. These allow engineers to see how autonomic networking is implemented in a variety of scenarios, giving them a solid grounding in applications and helping them generate their own solutions to real-world problems.
