1. Compute the displacements, reactions, and element forces for the trusses shown below. Cross-sectional area (in mm<sup>2</sup>) are shown in each bar. Knowing that modulus of elasticity,  $E = 200,000$  MPa.

Figure 1. Assignment no 1

2. The areas of bars  $ab$  and  $ac$  in mm<sup>2</sup> $\times 10^3$  are as indicated.  $A$  varies from 0 to  $40 \times 10^3$  mm<sup>2</sup>. (a) plot the variation in the force in each bar versus  $A$ . (b) If the allowable stress is 140 MPa, for approximately what value of  $A$  does the system have the highest ratio of load-carrying capacity to weight? Assume the same material is used for all three bars.

**Matrix Analysis Framed Structures** William Weaver, James M. Gere, 2012-12-06 Matrix analysis of structures is a vital subject to every structural analyst whether working in aero astro civil or mechanical engineering It provides a comprehensive approach

to the analysis of a wide variety of structural types and therefore offers a major advantage over traditional methods which often differ for each type of structure. The matrix approach also provides an efficient means of describing various steps in the analysis and is easily programmed for digital computers. Use of matrices is natural when performing calculations with a digital computer because matrices permit large groups of numbers to be manipulated in a simple and effective manner. This book, now in its third edition, was written for both college students and engineers in industry. It serves as a textbook for courses at either the senior or first year graduate level and it also provides a permanent reference for practicing engineers. The book explains both the theory and the practical implementation of matrix methods of structural analysis. Emphasis is placed on developing a physical understanding of the theory and the ability to use computer programs for performing structural calculations.
