**Abstract** - A smart city provides its people with high standard of living through advanced technologies and transport is one of the major focus. With the advent of autonomous vehicles (AVs), an AV-based public transportation system providing new forms of transportation services with high efficiency, high flexibility. Technology of autonomous vehicles (AVs) is becoming mature, and many AVs will appear on roads in the near future. In future AVs technology is used to for a all public. The AVs become connected with the support of various vehicular communication technologies. It manages a fleet of AVs to be coordinate transportation requests, offering point-to-point services with ride sharing. In order to perform its task, it is mounted by infrared sensors, camera and GPS receiver. There are two main problems in this system: scheduling and admission control. The scheduling problem is formulated as a mixed integer linear program, and the admission control problem is cast as a bilevel optimization. We validate the performance of the algorithms with real-world transportation service data.

**Key Words:** Autonomous vehicle (AV), Admission control, Bilevel Optimization, Smart City.

### 1. INTRODUCTION

Many people depend on public transport to move from one place to another when the their journeys are not short distances. The road-based public transport are buses and taxis, every transport system having some pros and cons. Buses generally used fixed routes offering shared ride so that more passengers can be served on each single journey. On the other hand, taxis offer private services and run on adjustable fixed routes based on the passengers' requests. Nevertheless, no single one type can support high throughput and flexibility at the same time [1]. The efficiency

and capacity of the whole public transportation system may be increased if there exists a new public transport which can coordinate many people in a short period of time and concure high mobility. It may maintain flexibility by offering point-to-point enhancing efficiency by supporting shared ride [11]. Such kind of public transport requires different features possess public transport. To established such a public transport, the vehicles need to cooperate to take up customers' requests instead of going around the city for incidental offers.

Unmanned Vehicle (UV) is a smart autonomous vehicle that mainly capable to do tasks without the need of human operator [4]. The unmanned bus is referred as Autonomous Vehicle. There are already autonomous buses driving in trial mode in some local routes, like: China and Switzerland. The technology is almost ready and most experts and researchers outline a timeline where the technology will mature to be used in production in 5-10 years. An intelligent AV-based public transportation system manages a fleet of AVs to coordinate transportation requests, offering point-to-point services with ride sharing. We focus on two important problems in the system: scheduling and admission control. The former is about how to assign the designated vehicles to the admissible transportation requests, and when and where the vehicles should reach to provide services with the lowest cost. The latter is to determine the set of admissible requests among all requests to achieve maximum revenue.

AVs are utilized as the conveyances to carry passengers in a city. The system can be made automatic and adaptive to transportation requests, with the consideration of traffic conditions. There is a control center (e.g., a central computing facility) for managing and scheduling the AVs, and making other related decisions for the system. Through adaptive scheduling, the optimal routes with the minimum operational cost can be determined for the AVs. With advanced vehicular communications technologies, like vehicular ad-hoc networks, the AVs become connected able to exchange information with the control center. Due to the unmanned nature, the AVs can coordinate with each other, and loyally and accurately follow the instructions from the control center. The system allows ride sharing; passengers may share their rides with other people, as buses.

This efficiency saves time and effort, streamlining the learning process and allowing individuals to focus on extracting the information they need. Furthermore, the availability of free PDF books and manuals fosters a culture of continuous learning. By removing financial barriers, more people can access educational resources and pursue lifelong learning, contributing to personal growth and professional development. This democratization of knowledge promotes intellectual curiosity and empowers individuals to become lifelong learners, promoting progress and innovation in various fields. It is worth noting that while accessing free Study On Autonomous Vehicle Transportation System PDF books and manuals is convenient and cost-effective, it is vital to respect copyright laws and intellectual property rights. Platforms

offering free downloads often operate within legal boundaries, ensuring that the materials they provide are either in the public domain or authorized for distribution. By adhering to copyright laws, users can enjoy the benefits of free access to knowledge while supporting the authors and publishers who make these resources available. In conclusion, the availability of Study On Autonomous Vehicle Transportation System free PDF books and manuals for download has revolutionized the way we access and consume knowledge. With just a few clicks, individuals can explore a vast collection of resources across different disciplines, all free of charge. This accessibility empowers individuals to become lifelong learners, contributing to personal growth, professional development, and the advancement of society as a whole.
