In order for the trillions of cells in the body to remain healthy they need to have a continuous supply of oxygen and nutrients. This is achieved because of the cardiovascular system. The parts of the cardiovascular system work together to deliver the needed oxygen and nutrients to the body tissues. A second function of the system is to then carry the waste products produced by the body tissues to the areas of the body where they can be eliminated. Blood cells contained in the circulating blood also play an important role in the immune system of the body.

When defined the term *cardiovascular* means pertaining to the heart and blood vessels. The components of this system include:

- Heart
- blood vessels
- blood

### Types of Blood Vessels

- **arteries** to carry blood away from the heart
- **veins** to carry blood toward the heart
- **capillaries** which are tiny vessels that join the arteries to the veins and they carry blood to the body organs.

### Structures of the Heart

The heart is a hollow muscular organ, which is about the size of your fist, and weights about eleven ounces. It is the contraction of this organ that provides the power to move blood through the vascular system of the body. The root word for heart is *cardi/o*.
