HYDRAULIC STRUCTURES

A hydraulic structure is a structure submerged or partially submerged in any body of water, which disrupts the natural flow of water. They can be used to divert, disrupt or completely stop the flow. An example of a hydraulic structure would be a dam, which slows the normal flow rate of river in order to power turbines. A hydraulic structure can be built in rivers, a sea, or any body of water where there is a need for a change in the natural flow of water.

The basin knowledge about Hydraulic structures with their usefulness and design etc will be dealt with in this course.

Module – II

Systems of irrigation:-

Various types of irrigation techniques differ in how the water obtained from the source is distributed within the field. In general, the goal is to supply the entire field uniformly with water, so that each plant has the amount of water it needs, neither too much nor too little. The various irrigation techniques are as under:

- i) Surface irrigation
- ii) Sub-surface irrigation

1) Surface irrigation:-

- a) Flow irrigation
- b) Lift irrigation

When the water is available at a higher level and it is supplied to lower level by the mere action gravity, then it is called flow irrigation. But if the water is lifted up by some mechanical (or) manual means such as by pumps etc. and then supplied for irrigation then it is called Lift irrigation. Use of wells and tube wells for supplying water for irrigation falls under the category of Lift irrigation.

Flow irrigation:-

- ☞ Perennial irrigation
