*Recent Developments in the Solution of Nonlinear Differential Equations* Bruno Carpentieri, 2021-09-08 Nonlinear differential equations are ubiquitous in computational science and engineering modeling fluid dynamics finance and quantum mechanics among other areas Nowadays solving challenging problems in an industrial setting requires a continuous interplay between the theory of such systems and the development and use of sophisticated computational methods that can guide and support the theoretical findings via practical computer simulations Owing to the impressive development in computer technology and the introduction of fast numerical methods with reduced algorithmic and memory complexity rigorous solutions in many applications have become possible This book collects research papers from leading world experts in the field highlighting ongoing trends progress and open problems in this critically important area of mathematics

**Mathematics of Complexity and Dynamical Systems** Robert A. Meyers, 2011-10-05 *Mathematics of Complexity and Dynamical Systems* is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e g the spontaneous formation of temporal spatial or functional structures These systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic The more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics *Mathematics of Complexity and Dynamical Systems* is an essential reference for all those interested in mathematical complexity from undergraduate and graduate students up through professional researchers

**Handbook of Dynamical Systems** B. Fiedler, 2002 This handbook is volume II in a series collecting mathematical state of the art surveys in the field of dynamical systems Much of this field has developed from interactions with other areas of science and this volume shows how concepts of dynamical systems further the understanding of mathematical issues that arise in applications Although modeling

issues are addressed the central theme is the mathematically rigorous investigation of the resulting differential equations and their dynamic behavior However the authors and editors have made an effort to ensure readability on a non technical level for mathematicians from other fields and for other scientists and engineers The eighteen surveys collected here do not aspire to encyclopedic completeness but present selected paradigms The surveys are grouped into those emphasizing finite dimensional methods numerics topological methods and partial differential equations Application areas include the dynamics of neural networks fluid flows nonlinear optics and many others While the survey articles can be read independently they deeply share recurrent themes from dynamical systems Attractors bifurcations center manifolds dimension reduction ergodicity homoclinicity hyperbolicity invariant and inertial manifolds normal forms recurrence shift dynamics stability to name just a few are ubiquitous dynamical concepts throughout the articles
