

Chapter 16 – Development, Stem Cells, and Cancer

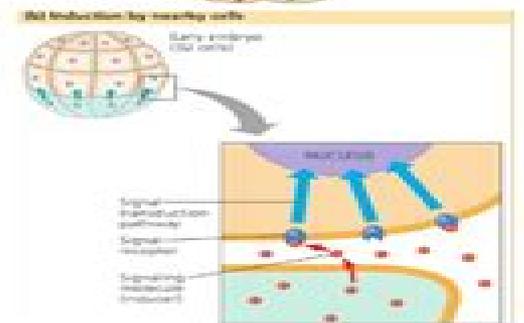

- ~ The development of a fertilized egg into an adult requires a precisely regulated program of gene expression.
- ~ Understanding this program has progressed mainly by studying **model organisms**.
- ~ Stem cells are key to the development process.
- ~ Orchestrating proper gene expression by all cells is crucial for life.

16.1 A program of differential gene expression leads to the different cell types in a multicellular organism

- ~ A fertilized egg gives rise to many different cell types.
- ~ Cell types are organized successively into tissues, organs, organ systems, and the whole organism.
- ~ Gene expression orchestrates the developmental program of animals.
- ~ The transformation from zygote to adult results from cell division, cell differentiation, and morphogenesis.
- ~ **Cell differentiation** is the process by which cells become specialized in structure and function.
- ~ The physical processes that give an organism its shape constitute **morphogenesis**.
- ~ Differential gene expression results from genes being regulated differently in each cell type.

- ~ Materials in the egg can set up gene regulation that is carried out as cell divide.
- ~ Materials in the egg can set up gene regulation that is carried out as cells divide.
- ~ An egg's cytoplasm contains RNA, proteins, and other substances that are distributed unevenly in the unfertilized egg.
- ~ **Cytoplasmic determinants** are maternal substances in the egg that influence early development.
- ~ As the zygote divides by mitosis, the resulting cells contain different cytoplasmic determinants, which lead to different gene expression.
- ~ The other major source of developmental information is the environment around the cell, especially signals from nearby embryonic cells.
- ~ In the process called **induction**, signal molecules from embryonic cells cause transcriptional changes in nearby target cells.
- ~ Thus, interactions between cells induce differentiation of specialized cell types.

- ~ **Determination** commits a cell irreversibly to its final fate.
- ~ Determination precedes differentiation.
- ~ Today, determination is understood in terms of molecular changes, the expression of genes for tissue-specific proteins.
- ~ The first evidence of differentiation is the production of mRNAs for these proteins.
- ~ Eventually, differentiation is observed as changes in cellular structure.
- ~ To study muscle cell determination, researchers grew embryonic precursor cells in culture and analyzed them.
- ~ They identified several "master regulatory genes," the products of which commit the cells to becoming skeletal muscles.
- ~ One such gene is called *myoD*.
- ~ While most cells are differentiating in a developing organism, some are genetically programmed to die.
- ~ **Apoptosis** is the best-understood type of "programmed cell death".
- ~ Apoptosis also occurs in the mature organism in cells that are infected, damaged, or at the end of their functional lives.

Stem Cells and Cancer Rebecca G. Bagley, Beverly A. Teicher, 2009-04-20 Significance of Stem Cells to Tumor Development Cancer stem cells remain a controversial topic and the criteria that define cancer stem cells are continuing to evolve A recent surge in stem cell research has ignited a field of discovery into many human diseases including diabetes neuropathologies and cancer By replacing specific differentiated cells that have either been lost or died stem cell therapy proves to be a very promising approach to the treatment of many debilitating diseases Though stem cells may provide therapeutic benefit under certain conditions they are also often implicated in the initiation progression and therapeutic resistance of malignant disease This first edition of Stem Cells and Cancer is intended to give a current perspective on the role of stem cells in cancer and strategies for novel therapies directed toward tumor stem cells The current cancer stem cell hypothesis is presented in several chapters with distinctions made between the hierarchical and stochastic models of tumor cell development Stemness self renewal pluripotency clonality and tumorigenicity are important concepts applied towards defining cancer stem cells Signaling pathways such as Wnt Sonic Hedgehog Notch and Bmi 1 that are involved in differentiation proliferation and survival are implicated in the malignant process Additional chapters address the identification of cancer stem cell populations through the evaluation of molecular markers such as CD133 CD44 and CD24 for example or by Hoescht dye
