dependability of embedded systems are obviously much better met by using high level language e g C compil ers instead of assembly However the use of C compilers frequently incurs a code quality overhead as compared to manually written assembly programs Due to the need for efficient embedded systems this overhead must be very low in order to make compilers useful in practice In turn this requires new compiler techniques that take the specific constraints in embedded system de sign into account An example are the specialized architectures of recent DSP and multimedia processors which are not yet sufficiently exploited by existing compilers
