

Weiss theory of Ferromagnetism (Qualitative treatment)

When ferromagnetic materials are placed in a magnetic field, it become strongly magnetized in the direction of the field. Order of magnetic susceptibility is 10^6 . They continue to retain magnetic property even after the magnetizing field is removed. Iron, Cobalt, Nickel etc. are examples.

In 1907, Weiss proposed a theory to explain the ferromagnetism. The important features of this theory are

1. In ferromagnetic materials, an additional magnetic field known as internal molecular field exist which leads to spontaneous magnetization. Later Heisenberg explained the origin of internal molecular field is due to quantum exchange interaction between the electrons.

2. The spontaneous magnetization exists in the material only below the Curie temperature T_c . Magnetic susceptibility of a ferromagnetic material is given by,

$$\chi = \frac{C}{T - T_c}$$

The above equation is called Curie-Weiss law where C is Curie constant.

3. The net magnetic moment of a ferromagnetic material in the absence of a magnetic field is zero. To explain this Weiss proposed ferromagnetic domain concept.
