Operations Research H. A. Eiselt, Carl-Louis Sandblom, 2010-05-17 Since the 1960s operations research or alternatively management science has become an indispensable tool in scientific management In simple words its goal on the strategic and tactical levels is to aid in decision making and on the operational level automate decision making Its tools are algorithms procedures that create and improve solutions to a point at which optimal or at least satisfactory solutions have been found While many texts on the subject emphasize methods the special focus of this book is on the applications of operations research in practice Typically a topic is introduced by means of a description of its applications a model is formulated and its solution is presented Then the solution is discussed and its implications for decision making are outlined We have attempted to maximize the understanding of the topics by using intuitive reasoning while keeping mathematical notation and the description of techniques to a minimum The exercises are designed to fully explore the material covered in the chapters without resorting to mind numbing repetitions

Shaw, 2015-11-11 Updated to integrate the management of associated information processes expand some application discussions and provide additional reference material the intent of this monograph is to help business professionals use waiting line queuing analysis methods to improve both service and manufacturing business applications of queuing situations Emphasis is given to discussing the caveats in applying waiting line theory and becoming aware of the assumptions used in developing that theory The importance of accounting for variability in waiting line processes is discussed in some detail because the basic queuing equations provide only average performance data under steady state conditions Understanding how much variability can exist for a given waiting line scenario provides a manager with the insight required to reduce these effects and develop innovative solutions for improving service while reducing operating costs In general the mathematical tone of the book is focused on applications not the derivation of the formulas presented The few derivation exceptions illustrate some approaches not commonly discussed in textbooks for example the use of state diagrams and random number approximations of the probability distributions for use in simple simulation models To aid in understanding the material presented some practical examples are given at appropriate points in the text and some simulation approaches using common spreadsheet software are described **Multiple Criteria Decision Analysis for Industrial Engineering** Gerald William Evans, 2016-12-01 This textbook presents methodologies and applications associated with multiple criteria decision analysis MCDA especially for those students with an interest in industrial engineering With respect to methodology the book covers 1 problem structuring methods 2 methods for ranking multi dimensional deterministic outcomes including multiattribute value theory the analytic hierarchy process the Technique for Order Preference by Similarity to Ideal Solution TOPSIS and outranking techniques 3 goal programming 4 methods for describing preference structures over single and multi dimensional probabilistic outcomes e g utility functions 5 decision trees and influence diagrams 6 methods for determining input probability distributions for decision trees influence diagrams and general simulation models and 7 the use of simulation modeling for decision analysis This textbook also offers Easy to follow descriptions of how to apply a wide variety of MCDA techniques Specific examples involving multiple objectives and or uncertainty risk of interest to industrial engineers A section on outranking techniques this group of techniques which is popular in Europe is very rarely mentioned as a methodology for MCDA in the United States A chapter on simulation as a useful tool for MCDA including ranking selection procedures Such material is rarely covered in courses in decision analysis Both material review questions and problems at the end of each chapter Solutions to the exercises are found in the Solutions Manual which will be provided along with

PowerPoint slides for each chapter The methodologies are demonstrated through the use of applications of interest to industrial engineers including those involving product mix optimization supplier selection distribution center location and transportation planning resource allocation and scheduling of a medical clinic staffing of a call center quality control project management production and inventory control and so on Specifically industrial engineering problems are structured as classical problems in multiple criteria decision analysis and the relevant methodologies are demonstrated
