**Principles of Cellular, Molecular, and Developmental Neuroscience** Oswald Steward,1989  
The field of cellular molecular and developmental neuroscience represents the interface between the three large well established fields of neuroscience cell biology and molecular biology In the last 10 to 15 years this new field has emerged as one of the most rapidly growing and exciting subdisciplines of neuroscience It is now becoming possible to understand many aspects of nervous system function at the molecular level and there already are dramatic applications of this information to the treatment of nervous system injury disease and genetic disorders Moreover there is great optimism that new strategies will emerge soon as a result of the explosion of information This book was written to introduce students to the major issues experimental strategies and current knowledge base in cellular molecular and developmental neuroscience The concept for the book arose from a section of an introductory neuroscience course given to first year medical students at the University of Virginia School of Medicine The text presumes a basic but not detailed understanding of nervous system organization and function and a background in biology It is intended as an appropriate introductory text for first year medical students or graduate students in neuroscience neurobiology psychobiology or related programs and for advanced undergraduate students with appropriate background in biology and neuroscience While some of the specific information presented undoubtedly will be outdated rapidly the gestalt of this emerging field of inquiry as presented here should help the beginning student organize new information

**The Cell Cycle** David Owen Morgan,2007 The Cell Cycle Principles of Control provides an engaging insight into the process of cell division bringing to the student a much needed synthesis of a subject entering a period of unprecedented growth as an understanding of the molecular mechanisms underlying cell division are revealed
