Load Capacity, Failure Mode and Design Criteria Investigation of Sand Jacks Paul Travis Sanders,2008 The Cumulative Book Index ,1998 A world list of books in the English language *Experimental Assessment of Aggregate Surfacing Materials* Robert Mokwa,2007 An extensive suite of geotechnical laboratory tests were conducted to quantify differences in engineering properties of three crushed aggregates commonly used on Montana highway projects The material types are identified in the Montana Supplemental Specifications as CBC 6A CBC 5A and CTS 2A Results from R value tests and direct shear tests performed on large samples 12 in by 12 in indicates the CBC 6A aggregates generally exhibited the highest strength and stiffness of the three material types In terms of strength parameters there was no statistically significant difference between CBC 5A and CTS 2A materials The CBC 6A and 5A materials exhibited similar average R values which were both slightly greater than the CTS 2A materials Overall the CTS 2A materials generally exhibited the lowest average strength and stiffness Although this material was the poorest performer when compared to the two CBC materials it still exhibited relatively high strength and stiffness Drainage capacity was quantified by conducting multiple saturated constant head permeability tests on 10 inch diameter samples of each material type The CBC 6A and CTS 2A materials had the highest average permeability values while the CBC 5A materials had the lowest Permeability was shown to depend more on the fine fraction void ratio $e_{sub f}$ than on aggregate type or maximum particle size An analytical method of predicting permeability based on $e_{sub f}$ was developed which will allow Montana Department of Transportation designers to estimate permeability based on gradation and state of compaction Overall the CBC 6A materials were generally the best performers in this study In general the CBC 5A aggregates exhibited the second highest strength and stiffness but also had the lowest drainage capacity The CTS 2A aggregates exhibited the lowest strength and stiffness but had relatively good drainage capacity The ability to substitute CTS 2A material for CBC aggregates depends on the relative importance that is assigned to strength stiffness and drainage in the pavement design model *The British National Bibliography* Arthur James Wells,2002 Electrical Transmission Line and Substation Structures Robert E. Nickerson,2007 This collection contains 36 papers on structural issues in the electrical transmission industry that were presented at the 2006 Electrical Transmission Conference held in Birmingham Alabama October 15 19 2006 **Assessing the Effectiveness and Environmental Impacts of Using Natural Flocculants to Manage Turbidity** Qilin Li,Laura Kegley,2005 The objective of this research was to determine the feasibility of using chitosan as a natural flocculant to control turbidity during in stream construction

work A series of field tests in Oak Creek Corvallis OR were conducted in order to test the effectiveness for turbidity control and the environmental impacts of applying chitosan directly into a stream environment No significant removal was obtained with chitosan doses up to 0.5 mg/L under the conditions tested mostly due to high pH of the creek and other unfavorable water quality parameters Water quality analysis for total organic carbon total phosphorus total Kjeldahl nitrogen and biochemical oxygen demand showed that chitosan does not adversely impact the aquatic environment at low doses Due to the inconclusiveness of the field test data a series of bench scale tests were conducted to evaluate the effectiveness of chitosan under controlled conditions as well as its responses to different test conditions e.g. pH initial turbidity chitosan dose and sediment type The bench scale tests were conducted using water collected from Oak Creek and a standard jar tester It was found that flocculation efficiency depends strongly on sediment type However the most critical factor that determines the effectiveness of chitosan seems to be an unidentified water quality parameter which is likely related to the organic matter in the stream
