Abstract – The dimpling process converts plain sheet into a dimpled sheet which gives higher energy absorption performance in various materials. In this paper effect of dimpling process on mechanical properties like tensile strength, a Yield strength of mild steel, stainless steel and aluminum was studied experimentally and numerically. First sheets were analyzed experimentally by using Taguchi's optimization method. Experimentally the manufacturing of the dimpled sheet was done by a punch and die tools. In this paper mild steel, aluminum and stainless-steel dimple sheet properties were evaluated for various properties numerical simulation of dimpling process was done in Ansys software. The simulation of the dimpling process and tensile test of the plain and dimpled specimens predicted similar behavior to experimental measurements and tests.

Keywords – Taguchi method, orthogonal arrays, S/N ratio, DOE

I. INTRODUCTION

The dimpling process is a cold roll forming process which includes dimpling of a flat strip. It is done to improve the material properties of the respective strip or material and its structural properties also maintaining minimum strip thickness. In this process punch and die, the method is used because it allows better flexibility regarding to size, dimension and efficiency. Solid metal pie is used in operation of punch and die, a punch is situated vertically above the die. Dimpling process is thus done by using a punch and die method. Proper material selection was done for better design and its optimization. Thus, by looking at various parameters aluminum, stainless steel and mild steel were selected. Various tests like chemical composition, tensile test, stress-strain graph have been concluded before the optimization. First tests have been done of a plain sheet and later on for dimpled sheet. After all these processes, the Taguchi method is used for optimization. Taguchi methods are statistical methods developed by Genichi Taguchi to improve the quality of manufactured goods and more currently also applied to engineering, biotechnology, marketing and advertising. However, Taguchi got to know methods of identifying those noise sources, which have the greatest effects on product variability. After applying the same, optimum values have been found out for each material. As it is trial and error method aim was to increase the strength of the dimpled sheet as the dimpling process increases the strength of the material.

II. METHODOLOGY:

1. MATERIAL SELECTION:

Material selection is the main part or step in the design of the component or selection of the component. It is the easiest and simple step but it is the main step which has a huge impact or drastic change on the extreme performance of the component. It is the most effective step in design engineering. The industrialization and commercialization of the final component rely on proper material selection. If a proper material selection is not done then even the best design can be failed. Criteria for material selection: Material selection can be done on the basis of their properties and depending upon our needs for the design of the component. For the best outcome, the proper material combination is selected. Properties like mechanical properties, wear and corrosion, ability to manufacture, economically feasible, availability in suitable sizes. The material must have strength and stiffness values. Should be anti-corrosive should not be extremely prone to corrosion. The material should be able to machine at a minimum cost. We should try to ensure the required sizes of material which are easily available.

2. MATERIAL TESTING:

1. MILD STEEL:

Mild steel is lighter in weight as compared to stainless steel since it has less carbon content. Mild steel is also relatively cheaper than other materials with similar mechanical properties.

1.1 Properties:

Grade – 40800

Standard – IS: 737-2008
