# Creating Windows Forms Applications with Visual Studio and C#
CSCE A331

Visual Studio on a Windows platform gives you a multitude of classes to easily create typical Windows GUI applications. If you elect to use these features, currently a C# application will only run on a Windows machine. There is similar functionality for C# GUI applications under Mono. In this lecture we will present just the basics to create some simple Windows apps.

Although it is possible to create windows applications purely in a textual environment, we will instead make use of the Visual Studio interface which lets us graphically drag and drop to determine the layout of our program. The VS environment will then generate the necessary code for us to perform the layout.

The following screenshots were created in VS 2013. If you have a different version, some windows and/or content may have changed but the basic process is the same. To create a Windows Forms Application, start Visual Studio and create a new Visual C# Project. Make sure you select a Windows Application as the template.

You will be presented with a blank **form**. This document assumes that you have the Toolbox pane visible on the left of the screen and the Properties on the right. These panes can be moved around and hidden. This pane contains common **controls** which make up the elements on the form. The layout is shown below:
