1 Derivation of the Method

In order to derive the fundamental concepts of FEM we will start by looking at an extremely simple ODE and approximate it using FEM.

1.1 The Model Problem

The model problem is:

$$\begin{aligned} -u'' + u &= x & 0 < x < 1 \\ u(0) &= 0 & u(1) = 0 \end{aligned} \tag{1}$$

and this problem can be solved analytically: $u(x) = x - \sinh x / \sinh 1$. The purpose of starting with this problem is to demonstrate the fundamental concepts and pitfalls in FEM in a situation where we know the correct answer, so that we will know where our approximation is good and where it is poor. In cases of practical interest we will look at ODEs and PDEs that are too complex to be solved analytically.

FEM doesn't actually approximate the original equation, but rather the *weak form* of the original equation. The purpose of the weak form is to satisfy the equation in the "average sense," so that we can approximate solutions that are discontinuous or otherwise poorly behaved. If a function $u(x)$ is a solution to the original form of the ODE, then it also satisfies the weak form of the ODE. The weak form of Eq. 1 is
