

# DNB Ophthalmology Solved Question Paper: Dec 2022 Paper 1

Q1. Discuss in detail the interventional modalities to halt progression of keratoconus. Discuss in detail the various refractive surgeries which can be done to provide visual rehabilitation in non- progressive keratoconus. [5+5]

Answer

The interventional modalities to halt progression of keratoconus are:

## \* Collagen cross linking (CXL, C3R)-

- Corneal collagen cross-linking (CXL) was first introduced by Wollensak et al. as a promising technique to slow or stop the progression of keratoconus.
- In CXL, riboflavin (vitamin B2) is administered in conjunction with ultraviolet A (UVA, 365 nm) which leads to the formation of reactive oxygen species, which ultimately leads to the formation of additional covalent bonds between collagen molecules, with consequent biomechanical stiffening of the cornea .
- CXL is followed using a standardized protocol (standard Dresden protocol), which involves epithelial removal, followed by dextran-based 0.1% riboflavin solution applied to the cornea for 20 min.
- The cornea is then exposed to a ultraviolet-A (UV-A) lamp, under an illumination intensity of 3 mW/cm<sup>2</sup> for 30 min, with a radiant exposure of 5.4 J/cm<sup>2</sup>

## \* Accelerated Cross-linking-

- Accelerated protocols have evolved in an attempt to overcome the limitations of conventional cross-linking (increased intraoperative time is a major drawback with standard Dresden protocol), while maintaining the efficacy of results.
