Effect of Stressed Skin Action on the Behaviour of Cold-formed Steel Portal Frames with Non-linear Flexible Joints and Top-hat Purlins Andrzej M. Wrzesien, 2016 A conceptual design of a cold formed steel CFS portal frame system proposed by the industrial partner is to be investigated and improved in light of known design challenges Unlike previous studies which focused on the behaviour of CFS bare frame this thesis focuses on the design and analysis methods for clad portal frames A wide range of design problems and industry practices have been investigated by testing as follows 1 Resistance and stiffness of bolted moment connections The bearing resistance and stiffness of the threaded bolt shank in single and double shear lapped connections were tested and compared against design recommendations The existing methods for deriving the moment resistance and the rotational stiffness of the moment connections were updated for tested joint configurations 2 Shear resistance and stiffness of cladding panels A total of eighteen 3 x 3 m cladding panels were tested including options in which sheeting is fixed on all four sides and fixed on two sides only The design features not yet recognized by design codes such as top hat purlins sheeting profiles fixed in the crest profile thickness less than 0.5mm and composite panels were investigated in the test programme 3 The difference in the structural behaviour of the bare and clad portal frames A series of six full scale laboratory tests were conducted on cold formed steel portal frame buildings in order to investigate the effects of joint flexibility and stressed skin diaphragm action The frames used for the laboratory tests were of 6m span 3m height 10 pitch and the frame spacing was 3 m When the difference in loads between 2D bare frame model and 3D stressed skin model were considered it was shown that the resistances and flexibilities of frames and cladding should be calculated or established by testing so safe and economical design is possible

Grummitt,1991      **The Design and Analysis of Haunched Portal Frames** Steven R. Preen,1981 This investigation was into the computized design and analysis of portal frame type structures which may include members of varying section by both elastic and plastic methods of analysis The objectives were to produce suitable design guide lines for the sizing of the frame members to produce an interactive plastic analysis program for use on micro computers and to expand the capability of the existing elasto plastic analysis program at the University of Bradford to cope with haunched members and to incorporate any applicable time and space saving devices The design guide lines were to be an extension of D I Blockley s paper The Design of Single Storey Pitched Roof Portal Frames published in 1970 Repeated analysis and geometrically similar frames with varying sections were performed and the results combined with the recommendations from Blockley s paper to produce design guides for the sizing and position of the individual members of the frame To produce a suitable plastic analysis program for use on a micro computer computer the Reactant Bending Moment or Graphical method analysis was chosen The advantages of this method are that it is commonly used in the design office it allows checking at intermediate stages in the analysis and the free bending moment distribution aids the selection of appropriate hinge positions The existing program at the University of Bradford was to be extended by introduction of routines which would allow haunched members and multiply loading to any member this would reduce computer storage and solution time but a special solution routine was required to determine the formation position of a hinge along a member The three objectives were completed and where possible compared with other proven methods of analysis      **Portal Frame Building Cost Benefit Analysis with Computer Aid** Angela Nevill,1994 The aim of this project is to develop a computer program that would enable quick cost benefit analyses to be preformed The end result of running through the program is a building of known height length width roof pitch bay spacing with the size and cost of its main members Due to inflation the price of members fluctuates It is for this reason that a procedure that allows the user to change the price of a member has been implemented into the program By running through the program a number of times the user is able to deduce the optimum bay spacing which results in the minimum cost for that size building The design resulting from the program should not be taken as gospel and once the optimum bay spacing has been found then further analysis should be preformed as bracing connections and foundations have not been considered in the program Abstract Synopsis      Plastic Analysis of Portal Frame Buildings Viet Cao Ma,1999
