## Abstract

We introduce a new approach to algorithmic investment management that yields profitable automated trading strategies. This trading model design is the result of a path of investigation that was chosen nearly three decades ago. Back then, a paradigm change was proposed for the way time is defined in financial markets, based on intrinsic events. This definition lead to the uncovering of a large set of scaling laws. An additional guiding principle was found by embedding the trading model construction in an agent-base framework, inspired by the study of complex systems. This new approach to designing automated trading algorithms is a parsimonious method for building a new type of investment strategy that not only generates profits, but also provides liquidity to financial markets and does not have a priori restrictions on the amount of assets that are managed.

## 1 Introduction

The asset management industry is one of the largest industries in modern society. Its relevance is documented by the astonishing amount of assets that are managed. It is estimated that globally there are 64 trillion USD under management [6]. This is nearly as big as the world product of 77 trillion USD [20].

### 1.1 Asset Management

Asset managers use a mix of analytic methods to manage their funds. They combine different approaches from fundamental to technical analysis. The time frames range from intraday, to days and weeks, and even months. Technical analysis, a phenomenological approach, is utilized widely as a toolkit to build trading strategies.

[Trading at the Speed of Light](#) Donald MacKenzie,2023-01-31 Trading at the Speed of Light tells the story of how many of our most important financial markets have transformed from physical trading floors on which human beings trade face to face into electronic systems within which computer algorithms trade with each other Tracing the emergence of ultrafast automated high frequency trading HFT since the early 2000s Donald MacKenzie draws particular attention to the importance of what he deems the material political economy of twenty first century finance Fast transmission of price data used to involve fibre optic cables but the strands in such cables are made of materials usually a specialised form of glass which slow light down to around two thirds of its speed in free space By contrast microwave and other wireless signals used in HFT travel through the atmosphere at nearly full light speed At these nanosecond speeds the physical nature of information transmission and the precise spatial location of the equipment involved become hugely important thus creating inevitable pinch points in the system MacKenzie details the ways in which these pinch points individual frequency bands specific locations on the roofs of computer data centres and particular sites for microwave towers are especially advantageous making it possible for those who control them to profit

from that control The book draws from over 300 interviews conducted with high frequency traders around the world the people who supply them with technological systems and communication links exchange staff and regulators as well as with others who function within markets that have not yet become dominated by HFT MacKenzie focuses most closely upon the four main sites of international HFT Chicago New York Amsterdam and London and examines both the technology and the politics underpinning modern financial markets Provided by publisher *High-Frequency Trading* Irene Aldridge,2009-12-22 A hands on guide to the fast and ever changing world of high frequency algorithmic trading Financial markets are undergoing rapid innovation due to the continuing proliferation of computer power and algorithms These developments have created a new investment discipline called high frequency trading This book covers all aspects of high frequency trading from the business case and formulation of ideas through the development of trading systems to application of capital and subsequent performance evaluation It also includes numerous quantitative trading strategies with market microstructure event arbitrage and deviations arbitrage discussed in great detail Contains the tools and techniques needed for building a high frequency trading system Details the post trade analysis process including key performance benchmarks and trade quality evaluation Written by well known industry professional Irene Aldridge Interest in high frequency trading has exploded over the past year This book has what you need to gain a better understanding of how it works and what it takes to apply this approach to your trading endeavors *Algorithmic Trading* IntroBooks Team, Algorithmic trading is an exchange mechanism where computers make choices about what to buy and sell in the money markets The purpose of algorithmic trading would be to either make money by buying lower and selling higher or to minimize transaction costs by effectively buying or selling large volumes of financial commodities Depending on those guidelines the computer determines when and how much to buy and sell And these norms are designed by manual efforts Algorithmic Trading typically involves understanding of the financial marketing domain programming and knowledge related to data sciences Algorithmic trading can be broken down into two segments The revelation of market inefficiencies People are looking in the markets for something unfair that they can leverage To illustrate if two exchanges value a similar financial product differently there may be a variance People devise a plan to exploit the business incompetence they have detected It entails determining the ideal moment to buy and sell the exact quantity to buy and sell and how to end the trading operations *Algorithmic Trading: A Comprehensive Beginner's Guide to Learn Algorithmic Training from A-Z* Stewart Gray,2019-03-22 Algorithmic Trading is a term known by many names automated trading system Black box trading algo trading and quantitative trading It is a system of trading that makes use of computers pre programmed with specific trading instructions also known as algorithm for these computers to carry out in response to the stock market Trade processes such as buying and selling bonds futures and stocks are therefore carried out by these computers allowing the traders utilizing them to buy and sell shares in huge amounts and in speeds that is supposedly impossible for humans The algorithms that these computers run on are based from historical
