Abstract

We introduce a new approach to algorithmic investment management that yields profitable automated trading strategies. This trading model design is the result of a path of investigation that was chosen nearly three decades ago. Back then, a paradigm change was proposed for the way time is defined in financial markets, based on intrinsic events. This definition lead to the uncovering of a large set of scaling laws. An additional guiding principle was found by embedding the trading model construction in an agent-base framework, inspired by the study of complex systems. This new approach to designing automated trading algorithms is a parsimonious method for building a new type of investment strategy that not only generates profits, but also provides liquidity to financial markets and does not have a priori restrictions on the amount of assets that are managed.

1 Introduction

The asset management industry is one of the largest industries in modern society. Its relevance is documented by the astonishing amount of assets that are managed. It is estimated that globally there are 64 trillion USD under management [6]. This is nearly as big as the world product of 77 trillion USD [20].

1.1 Asset Management

Asset managers use a mix of analytic methods to manage their funds. They combine different approaches from fundamental to technical analysis. The time frames range from intraday, to days and weeks, and even months. Technical analysis, a phenomenological approach, is utilized widely as a toolkit to build trading strategies.

 The Alpha Engine Anton Golub,2017 We introduce a new approach to algorithmic investment management that yields profitable automated trading strategies This trading model design is the result of a path of investigation that was chosen nearly three decades ago Back then a paradigm change was proposed for the way time is defined in financial markets based on intrinsic events This definition lead to the uncovering of a large set of scaling laws An additional guiding principle was found by embedding the trading model construction in an agent base framework inspired by the study of complex systems This new approach to designing automated trading algorithms is a parsimonious method for building a new type of investment strategy that not only generates profits but also provides liquidity to financial markets and does not have a priori restrictions on the amount of assets that are managed *Detecting Regime Change in Computational Finance* Jun Chen,Edward P K Tsang,2020-09-14 Based on interdisciplinary research into Directional Change a new data driven approach to financial data analysis Detecting Regime Change in Computational Finance Data Science Machine Learning and Algorithmic Trading applies machine learning to financial market monitoring and algorithmic trading Directional Change is a new way of summarising price changes in the market Instead of sampling prices at fixed intervals such as daily closing in time series it samples prices when the market changes direction zigzags By sampling data in a different way this book lays out concepts which enable the extraction of information that other market participants may not be able to see The book includes a Foreword by Richard Olsen and explores the following topics Data science as an alternative to time series price movements in a market can be summarised as directional changes Machine learning for regime change detection historical regime changes in a market can be discovered by a Hidden Markov Model Regime characterisation normal and abnormal regimes in historical data can be characterised using indicators defined under Directional Change Market Monitoring by using historical characteristics of normal and abnormal regimes one can monitor the market to detect whether the market regime has changed Algorithmic trading regime tracking information can help us to design trading algorithms It will be of great interest to researchers in computational finance machine learning and data science About the Authors Jun Chen received his PhD in computational finance from the Centre for Computational Finance and Economic Agents University of Essex in 2019 Edward P K Tsang is an Emeritus Professor at the University of Essex where he co founded the Centre for Computational Finance and Economic Agents in 2002 **High-Performance Computing in Finance** M. Yes, most PDF viewers/editors like Adobe Acrobat, Preview (on Mac), or various online tools allow you to fill out forms in PDF files by selecting text fields and entering information. Are there any restrictions when working with PDFs? Some PDFs might have restrictions set by their creator, such as password protection, editing restrictions, or print restrictions. Breaking these restrictions might require specific software or tools, which may or may not be legal depending on the circumstances and local laws.
