scientific research Because of the significant impact that models and the outcomes of modeling will have on both our work and our personal lives it is imperative that we have a solid understanding of models and have faith in the results of modeling This is something that should be kept in mind by analysts engineers physicians researchers and scientists in general Many years ago picking a model that was transparent to human practitioners or customers often meant selecting basic data sources and simpler model forms such as linear models single decision trees or business rule systems This was the case since selecting a model that was transparent required less processing power This was the situation as a result of the fact that picking a model that was transparent to human practitioners or customers in general entailed picking a model Even though these more easy approaches were typically the best option and even though they continue to be the best option today they are subject to failure in real world circumstances in which the phenomena being replicated are nonlinear uncommon or weak or very distinctive to particular individuals Despite the fact that they continue to be the best option they are sensitive to failure in these kinds of scenarios The conventional trade off that existed between the precision of prediction models and the simplicity with which they could be interpreted has been abolished nevertheless it is likely that this trade off was never truly required in the first place There are technologies that are now accessible that can be used to develop modeling systems that are accurate and sophisticated based on heterogeneous data and techniques for machine learning and that can also aid human comprehension of and
