Background:

Cloud computing is one of the innovative computing, which deals with storing and accessing data and programs over the internet [1]. It is the delivery of computing resources and services, such as storing of data on servers and databases, providing networking facilities and software development platforms over the internet. It provides the flexibility of resources for everyone. These services are provided via data centers, which are located in various parts of the world [2, 3]. Cloud computing makes access to these resources to everyone on a global scale at a very minimal cost and significantly higher speed. These servers provide services to the users, which would have cost a lot of computational power to them if they had to buy them. The first mention of cloud computing was referenced in a Compaq internal document released in 1996 [4]. Cloud computing was first commercialized in 2005 when Amazon released elastic compute cloud (EC2). Furthermore, Google released Google app engine in 2008 and Microsoft Azure services were launched in October 2008, which increased the competition in the area of cloud computing. Since then these companies have done a lot of development in cloud computing.

Types and Services:

All the servers or clouds are not identical and one of the clouds is not fulfilling the requirements for everyone. As a result, there are various architectures and models of clouds, which serve the specific purpose based upon the needs of the users. There are three ways to run cloud services, namely public cloud, private cloud and hybrid cloud. The third-party cloud service providers own the public cloud and they provide the users with the storage services on servers and databases over the internet. Moreover, they provide a lot of other services like virtual machines for processing large amounts of data and programs, which is not possible

to be processed on a single computer [5]. Private cloud, as the name suggests, refers to the resources provided to a single organization, located locally in its premise or sometimes hosted on the off premise. It is usually used by organizations due to the sensitivity of the data and other privacy concerns. On the other hand, hybrid cloud is the mixture of resources of public cloud and private cloud by permitting the data and programs to be shared between them. It plays an important role when the computing and processing demand fluctuates [6]. It allows the seamless scale-up of resources to a public cloud to handle the fluctuating demand, without giving third-party access to the entire data. The sensitive data lies safely behind the firewall. These clouds offer various types of services in which infrastructure as a service (IaaS) is one of them. It offers services that include remote access of a full-pledged computer infrastructure, like virtual computers, servers, storage devices, etc. The other service offered by the cloud is platform as a service (PaaS), which allows user to host the application on remote server. It provides required resources, such as middleware, database, operating system, networking and many more. The third type of service is software as a service (SaaS), which provides the applications to the users via the internet.

Applications in Society:

Cloud computing is used in various sectors of society. Government organizations use the cloud to store the data of various departments. They make the use of IaaS to store data on the servers. They even host applications on the cloud using PaaS. Some organizations use the private cloud due to sensitive data [7]. Cloud computing has made it easy for the government organizations to share data and collaborate among various departments. National informatics centre (NIC) offers the cloud services to various government organizations in India. It provides a private cloud to handle the jobs of Indian

government organizations. It is responsible for hosting websites and handling data of various examinations conducting councils and ministries. Multiple business organizations and industries make use of PaaS and SaaS to host their applications on the internet and make them available to the users. SaaS is used by Google to provide various applications to users over the internet, such as Google documents, sheets, slides and forms. Google also provides a Google cloud platform (GCP), which offers all the services (i.e., IaaS, PaaS and SaaS). GCP is used by many software developers to build and deploy applications at a very low cost. It is even used to collaborate with other users and it also offers them the flexibility to expand according to their needs at a very low cost. Various companies and organizations also use GCP for training machine learning and deep learning models.

Challenges and Open issues:

In the month of January 2018, RightScale initiated its annual survey on the trends of cloud [8]. They interviewed 997 technical professionals working in different organizations using the cloud. They found various challenges cloud, which are presented as follows. Security and privacy have always been a concern for cloud computing. The third-party service providers can access the data of users and may sell it to other organizations, without any permission from the user. The data can be misused for many purposes like identifying personality trait of a particular user and its political interests of the user. According to the cloud security alliance, the main threats posed to data. This is due to insecure interfaces and application programming interface (API), data loss and leakage, and hardware failure [4]. The other privacy concern is the hacking. If the hackers hack the data servers, they would be getting a handful of the sensitive data of various users across the globe. As a result, as far as privacy concerns, some government

Technology Trade Theory (TripleT) Mohammad AbdulQadir Obeidat,2016-07-19 Doctoral Thesis Dissertation from the year 2013 in the subject Computer Science Commercial Information Technology grade 3 87 4 00 Girne American Universtity College of Business course MIS language English abstract Even though cloud computing is one of the hottest growth areas in the field of IT today the existing body of literature related to cloud computing remains surprisingly small The few research studies extant in the area have primarily focused on two broad areas including the technical implications of implementing cloud computing solutions and the impact of cloud computing adoption by individual and organizational users The behavioral aspects of cloud computing adoption and especially using adoption models as a theoretical basis remain least studied and most misunderstood Moreover existing models have been tested and used to gauge the behavior intention to adopt technology from a single perspective Accordingly this study proposes a new model for evaluating technology adoption with specific reference to cloud computing adoption the Technology Trade Theory model This model is derived from the synthesis of the Technology Acceptance Model and the Social Exchange Theory The Triple T model proposes that technology acceptance is the result of a trade process The purpose of this trade is to maximize advantages and minimize disadvantages Prospective adopters will weigh the potential advantages and disadvantages of the technology and will only adopt the technology when its advantages outweigh its disadvantages Data is collected using a panel study administered to a sample of middle and top level IT managers Relationships between the variables are assessed using the Pearson product moment correlation coefficient Significance is tested by means of paired two tailed tests Even though the study validates most of the relationships between variables in the TAM model it still finds that the TAM model has less predictive ability Since the proposed Triple T model addresses many of the weaknesses in the TAM model the study proposes it to be a better model The proposed Triple T model also finds that a single advantage may outweigh numerous disadvantages or that a single disadvantage may outweigh numerous advantages during the adoption process and therefore executive decisions to adopt technology are often driven by just one advantage or disadvantage to the exclusion of all the others These findings suggest that substantial improvement in the prediction of technology adoption intention is possible when previous models are integrated with the Social Exchange Theory
