

Basic radar principles

Introduction

- *RADAR - Radio Detection and Ranging.*
- *Scientist Heinrich Hertz demonstrated in 1886 that radio waves would reflect from metal.*
- 1930s UK, Germany, France and USA developed radar techniques.
- Radar at sea on a warship in 1937.
- After WWII the radar started to enter merchant ships.
- Developed to suite the civil navigation and collision avoidance.

The Echo Principles

- A radar system has a transmitter that emits radio waves called radar signals in predetermined directions. When these meet an object, they are usually reflected or scattered in many directions. However, some of them absorb and penetrate into the target to some degree. Radar signals are reflected especially well by materials of considerable electrical conductivity — especially by most metals, by seawater and by wet ground. Some of these make the use of radar altimeters possible. The radar signals that are reflected back towards the transmitter are the desirable ones that make radar work. If the object is moving either toward or away from the transmitter, there is a slight equivalent change in the frequency of the radio waves, caused by the Doppler Effect.
- Radar receivers are usually, but not always, in the same location as the transmitter. Although the reflected radar signals captured by the receiving antenna are usually very weak, they can be strengthened by electronic amplifiers.
