

Cost Accounting - Study Guide in Process Costing

The process cost system is used by the companies who manufacture on a continuous basis of which the products are homogenous and the processing of the product will take place into different departments. This accounting system is ideal in mass production. The primary objective of this system is the allocation of manufacturing costs in every department to calculate the unit cost of the product for profit determination and inventory costing purposes. Usually in the production not all units that put into process are completed, and so there are work in process. To account for this units, there is a need to prepare a **cost of production report**.

The cost of production report is being prepared by department on a monthly basis. This would show the flow of number of units as well as cost related each respective department. Using this report will help the management to evaluate and understand the operations of every department. This report shows two schedules the QUANTITY and COST schedule. The quantity schedule shows the number of units to be accounted for. On the other hand, the cost schedule shows the cost per equivalent unit of production (EUP). Normally not all units are completed during the period and so there is a need to compute for the Equivalent Unit of Production in order to compute unit cost. To compute for the EUP we just multiply the number of units to the percentage of completion.

There are two methods used in process costing the **weighted average method** and the **first in, first out (FIFO) method**. The difference between the two methods is on how to account the work in process beginning. Under the weighted average method the work in process beginning is ignored and all units is treated as if all units were all started in process in the current month. On the other hand, FIFO method accounts the work in process beginning based on the stage of completion.

web jun 6 2023 7 cantilever beam triangular load formulas bending moment and shear force diagram cantilever beam with triangular line load bending moment $m_x = \frac{1}{6} q \cdot x^3 / l$ max bending moment $m_{max} = \frac{1}{6} q \cdot l^2$ shear force at support $v_a = \frac{1}{2} q \cdot l$ reaction forces $r_a = \frac{1}{2} q \cdot l$

macaulay cantilever beam moment formulas triangular load - Dec 27 2021

web later this macaulay cantilever beam moment formulas triangular load but end up in damaging downloads it will without a doubt squander the period if you enterprise to download and configure the macaulay cantilever beam moment formulas triangular load it is entirely basic then presently we extend the
